Annex

Chairman's revised draft text of the guidelines for the preparation of national communications by Parties included in Annex I to the Convention	9
---	---

I. INTRODUCTION

A. Mandate

1. The Subsidiary Body for Scientific and Technology Advice (SBSTA), at its seventh session, agreed to consider at its ninth session what, if any, additions and/or amendments to the guidelines for the preparation of national communications by Parties included in Annex I to the Convention would be required (UNFCCC reporting guidelines) (FCCC/SBSTA/1997/14, paragraph 16 (d)).
2. At its eighth session, the SBSTA requested the secretariat to send a questionnaire to Parties on clarifications, additions and/or amendments to the revised UNFCCC reporting guidelines. The submissions would then be compiled into a miscellaneous document. It requested the secretariat to organize a workshop with the aim of proposing any necessary clarifications, additions and/or amendments to the UNFCCC reporting guidelines, at the fifth session of the Conference of the Parties (FCCC/SBSTA/1998/6, paragraph 30).
3. The SBSTA, at its ninth session, requested the secretariat to prepare a paper on clarifications, additions and/or amendments to the UNFCCC reporting guidelines, taking into account the information from the workshop, for consideration at its tenth session¹ (FCCC/SBSTA/1998/9, paragraph 51 (b), (d) and (e)).
4. At its tenth session, the SBSTA concluded that discussions on revisions to part II of the UNFCCC reporting guidelines, should continue at its eleventh session. It further requested the secretariat to prepare a document reflecting the status of discussions on the draft text of part II of the guidelines at the close of the tenth session (FCCC/SBSTA/1999/6, paragraph 27 (h)).

B. Scope of the note

5. In response to the above mandate, this note contains revised draft guidelines for the preparation of national communications by Parties included in Annex I to the Convention: Part II, Reporting guidelines on other issues.² A text reflecting the status of discussions at the close of the tenth session of the SBSTA is contained in document FCCC/SBSTA/1999/13/Add.1.³ The latter document contains revisions proposed by Parties and

¹ The secretariat made available the following documents for the tenth session of the SBSTA: FCCC/SB/1999/1, FCCC/SB/1999/1/Add.1, FCCC/SB/1999/1/Add.2, FCCC/SB/1999/1/Add.3, FCCC/SB/1999/MISC.2, FCCC/SBSTA/1999/INF.1, FCCC/SBSTA/1999/INF.1/Add.1, FCCC/SBSTA/1999/INF.2, FCCC/SBSTA/1999/INF.3. Of these, documents FCCC/SB/1999/1/Add.2 and FCCC/SB/1999/MISC.2 relate to part II of the UNFCCC reporting guidelines.

² Referred to as 'the Chairman's revised draft text'.

³ Referred to as 'Working Paper No. 4'.

the co-Chairs to the joint contact group on Annex I national communications at the tenth session of the SBSTA and editorial corrections. In addition, Parties may wish to refer to document FCCC/SBSTA/1999/13/Add.2, which contains draft guidance for reporting on global climate observing systems from the Global Climate Observing System (GCOS) secretariat.

6. This note explains the principal differences between the Chairman's revised draft text and Working Paper No. 4. It also identifies a few additional options for changes Parties may wish to consider.

C. Possible action by the SBSTA

7. The SBSTA may wish to consider the information contained in this note and in the addenda, determine whether the Chairman's revised draft text or Working Paper No. 4 should serve as a basis for further discussions at the eleventh session, endorse or modify their main elements and provide guidance related to a draft decision for consideration by the COP at its fifth session.

II. APPROACH USED TO PREPARE THE CHAIRMAN'S REVISED DRAFT TEXT

A. Background

8. The Chairman's revised draft text takes into consideration documents FCCC/SB/1999/1/Add.2, FCCC/SBSTA/1999/13/Add.1 and decision 9/CP.2. An attempt has also been made to ensure consistency with part I of the guidelines for the preparation of national communications by Parties included in Annex I to the Convention (FCCC/SBSTA/1999/6/Add.1).

9. The Chairman's revised draft text is based on consultations between the Chairman of the SBSTA, the co-Chairs of the joint contact group and the secretariat. It attempts to reflect concerns expressed by Parties through the co-Chairs, about a lack of clarity in Working Paper No. 4.

B. General approach

10. Taking into account the views expressed during consultations, the Chairman's revised draft text aims to present the reporting guidance in a more logical and structured way, without changing the nature of the information being requested. To a large extent, this has been achieved by simply changing the order of paragraphs and adding headings.

11. The secretariat, to the extent possible, has maintained text already agreed by the joint contact group. In the case of those sections which had little or no consideration by the joint contact group, the Chairman's revised draft text has been able to incorporate most country proposals, as contained in Working Paper No. 4, as they are generally complementary.

C. Explanatory text

12. In addition to a description in this note of the main differences between Working Paper No. 4 and the Chairman's revised draft text, other changes are explained in footnotes to the Chairman's revised draft text. Minor editorial changes are not highlighted.

13. Below, paragraph numbers relate to the Chairman's revised draft text.

**III. MAIN DIFFERENCES BETWEEN WORKING PAPER NO. 4
AND THE CHAIRMAN'S REVISED DRAFT TEXT**

A. Generic issues

14. The term 'national communication' has been used throughout the Chairman's revised draft text in preference to 'communication' or 'report' where these terms occurred. Furthermore, the title 'National Report' has been replaced with the original title contained in document FCCC/SB/1999/1/Add.2. Parties may wish to give further thought to this matter.

15. In order to provide a framework for the guidelines, headings have been included in each section. For consistency, the annex to the guidelines, providing an overall structure for the national communications, uses these same headings, where relevant.

16. In revising the text, the secretariat examined the use of every term such as 'shall', 'could', 'to the extent possible', 'encouraged' etc. For clarity, in general, only the terms 'shall', 'should' and 'may' are used in the Chairman's revised draft text. The term 'shall' is used where the request for information can be related to Articles 4 and/or 12 of the United National Framework Convention on Climate Change (UNFCCC). In general, it is used in relation to broad requests for information at the start of each section or subsection. The term 'should' is generally used where more detailed information is required and the term 'may' is used where maximum flexibility is allowed in reporting. These terms have been underlined. For information, where a term has been changed, relative to Working Paper No. 4, the previously used term is shown in parentheses. Parties may wish to give careful consideration to the appropriate term in each case.

B. National circumstances

17. Several changes were made in the Chairman's revised draft text reflecting concerns that too much information was being requested in an unstructured way. In the joint contact group, Australia proposed reducing the amount and simplifying the type of information requested. Their text proposal is contained in Working Paper No. 4. This was used as the basis of the Chairman's revised draft text. Headings have been added to provide a structure in which Parties need only provide information which relates their national circumstances to climate change issues, thereby further reducing the volume of information required. The elements of the Australian text have been retained under this structure, although requests to provide information

about policies have been deleted, as Parties should provide such information in the policies and measures section. Requests to provide 'indicators' for particular sectors have been replaced by a general request for Parties to provide such data if it assists in explaining their national circumstances and/or the relevance of their national circumstances to greenhouse gas (GHG) emissions.

C. Greenhouse gas inventory information

18. The text remains unchanged in requesting the provision of summary tables, based on the common reporting format and in accordance with part I of the guidelines and allows this information to be presented as an annex to the national communication. In this circumstance, the reader may need to refer to an annex to obtain basic information about trends in GHG emissions. For this reason, an additional paragraph 18 has been added to the Chairman's revised draft text to request the provision of diagrams for each GHG along with a summary description of emission trends.

D. Policies and measures

19. There have been very few changes to the text related to policies and measures, but the paragraph order has changed to create a more logical structure. The text described as the 'co-Chair's proposal' in Working Paper No. 4 became paragraph 23 in the Chairman's revised draft text, to describe how the reporting of policies and measures shall be organized. This proposal favours a summary table for each sector, in preference to a single table with a column entitled 'sector'.

20. The joint contact group discussed whether the reporting of policies and measures and projections should be along the lines of the Intergovernmental Panel on Climate Change (IPCC) inventory categories or economic sectors. In the Chairman's revised draft text, for table 1, Parties are requested to report, to the extent appropriate, using the six sectors mentioned in the Convention, and in the projections section Parties are requested to use the same sectors. Parties may wish to further consider this issue.

E. Projections and the total effects of policies and measures

21. Although many of the paragraphs remain unchanged or with minor modifications, parts of the projections section have been substantially rewritten to add clarity, without any significant changes in reporting requirements compared to Working Paper No. 4. A distinction is made between the type of projections a Party shall or may conduct and the way in which the projections shall be presented against actual inventory data for preceding years. The guidelines then set out what information about the total effect of policies and measures should be reported. They also explain what type of information is required to explain how the projections were made and what key data are required in order to explain emission trends over time.

22. It should be noted that the information requested about key data relative to projections allows a Party to provide data which assist the reader in understanding actual and projected GHG emissions. This should be borne in mind when consideration is given to the national circumstances section where Parties are requested to provide information that explains how their national circumstances affect such activities or emissions rather than duplicating what is required in the projections section.

F. Financial resources and the transfer of technology

23. The secretariat has used the text from the Chairman's original draft text (FCCC/SB/1999/1/Add.2) in the Chairman's revised draft text. The Parties may also refer to Working Paper No. 4 to take note of deletions and additions suggested by Parties in the joint contact group.

G. Research and systematic observation

24. Draft guidance from the Global Climate Observing System secretariat for reporting on global climate observing systems is contained in an addendum to part II of the guidelines (FCCC/SBSTA/1999/13/Add.2).

IV. FURTHER OPTIONS FOR CHANGES TO THE CHAIRMAN'S REVISED DRAFT TEXT

A. Substantive options for change

25. The Parties may wish to consider the following changes to the Chairman's revised draft text:

(a) Whether definitions are required in the guidelines and, if so, which ones. (The Chairman's revised draft text retains the European Union (EU) text previously contained in Working Paper No. 4.);

(b) If the section on 'Coverage' is necessary. Parties may wish to consider if paragraph 3 is covered by paragraph 1 (a) and whether paragraph 4 is covered by part I of the guidelines, given that Parties are asked to provide summary tables in accordance with part I of the guidelines;

(c) Whether the text in the 'National circumstances' section could be further simplified so that the sub-items (a) to (k) under paragraph 13 do not specify, in detail, the information to be provided but that only the underlined headings remain. In this way, Parties would need to judge what data are relevant in the context of paragraph 13;

(d) Whether information on 'Research and systematic observation' should be provided in a separate document in order to limit the volume of the national communication and provide an opportunity for Parties to more fully describe activities in this area;

(e) Whether the request for Parties to provide projections of carbon monoxide, nitrogen oxides, non-methane volatile organic compounds and sulphur oxides emissions should be deleted.

B. Other options for change

26. Parties may also wish to consider the following, less significant possible changes, also noted in footnotes to the Chairman's revised draft text:

(a) Whether a new title should be given to part II of the national communication (and, if so, whether it should be used throughout the guidelines, in preference to 'national communication');

(b) If a column should be added to table 1 to relate to 'objectives' (or activity affected by the policy) to be consistent with the elements in the description of policies and measures that Parties are to provide under paragraph 29;

(c) If the terms to describe the 'type' of policy under paragraph 29, sub-item (d), are sufficiently clear or whether alternative terms should be found;

(d) If reporting of policies and measures and projections should be along the lines of economic sectors (in line with the Convention) or along the lines of inventory categories;

(e) If there should be a request to supply information about 'best practices' in relation to policies and measures.

Annex

**CHAIRMAN'S REVISED DRAFT TEXT OF THE GUIDELINES FOR THE
PREPARATION OF NATIONAL COMMUNICATIONS BY PARTIES
INCLUDED IN ANNEX I TO THE CONVENTION**

Part II: Reporting guidelines on other issues

I. INTRODUCTION

A. Objectives

1. The objectives of these guidelines for preparing the national communication are:

(a) To assist Annex I Parties in meeting their commitments under Articles 4 and 12 of the Convention;

(b) To promote the provision of consistent, transparent, comparable, accurate and complete information in order to enable a thorough review and assessment of the implementation of the Convention by the Parties, and to monitor the progress they are making towards meeting the goals of the Convention; and

(c) To ensure that the Conference of the Parties (COP) has sufficient information, in accordance with Article 4.2(d), to carry out its responsibilities to review the implementation of the Convention and the adequacy of the commitments in Article 4.2(a) and (b).

[B. Definitions]¹

2. [In the context of these guidelines:

EU text follows:

Implemented policy or measure means a policy or measure in respect of which one or more of the following applies: (a) national legislation is in force; (b) one or more voluntary agreements have been established; (c) financial resources have been allocated; (d) human resources have been mobilized.

Transparency means that the text of the national communication is intelligible in terms of national actions and circumstances. Full *transparency* means that the quantitative and qualitative

¹ The joint contact group decided to return to the question of which, if any, terms need definition after considering the entire text and taking into account the definitions already included in part I of the guidelines.

results could be reconstructed by a reader² on the basis of the information provided. In practical terms the amount of information that a Party would have to provide in order to achieve full transparency would be very great. However a Party would normally be expected to have access to the necessary information to provide full *transparency* if needed in some areas for review purposes.

Consistency means that data, sectoral definitions, calculation methods and technical terms which are used in the national communication, or which occur both in the national communication and national inventories, have the same values, definitions, or significance wherever they occur, and that any associated time-series are calculated on the same basis throughout.

Comparability means that methodologies agreed by the Parties have been used, for example to estimate greenhouse gas inventories, and that other internationally agreed definitions and methodologies have been employed.]

[C. Coverage]

3. [In accordance with Articles 4.1(j) and 12.1(a) and (b), a national communication shall describe the actions by Annex I Parties that significantly contribute to the implementation of their Convention obligations. In accordance with Article 12.3, Annex II Parties shall also report on finance and technology transfer measures to implement Article 4.3, 4.4 and 4.5.]

4. [In accordance with Articles 4 and 12, and consistent with part I of the reporting guidelines, a national communication shall describe anthropogenic emissions by sources and removals by sinks of all greenhouse gases (GHGs) not controlled by the Montreal Protocol. At a minimum, the national communication shall contain information on the following six greenhouse gases: carbon dioxide (CO₂), methane (CH₄), nitrous oxide (N₂O), perfluorocarbons (PFCs), hydrofluorocarbons (HFCs), and sulphur hexafluoride (SF₆). The national communication should provide information on any other greenhouse gases whose 100-year global warming potential (GWP) values have been identified by the Intergovernmental Panel on Climate Change (IPCC) and adopted by the COP. The national communication should also provide information on the following indirect greenhouse gases: carbon monoxide (CO), nitrogen oxides (NO_x) and non-methane volatile organic compounds (NMVOCs). Parties may also (are also encouraged to) provide information on sulphur oxides (SO_x) in their national communications.]

D. Structure

5. The information identified in these guidelines shall be communicated by a Party in a single document, 500 copies of which shall be submitted to the secretariat in one of the official languages of the United Nations. The length of a national communication may be decided by the

² The term 'reader' is now used instead of 'Party', 'second Party' or 'third Party' throughout the guidelines, unless a Party to the Convention is being referred to.

submitting Party but every effort shall (should) be made to avoid over-lengthy national communications, in order to reduce the paper burden and to facilitate the consideration process. Parties shall also provide an electronic version of their national communication to the secretariat.³

6. Annex I Parties should also (are also encouraged to) submit to the secretariat, where relevant, a translation of their national communication into English.

7. Parties should (are encouraged to) provide additional relevant background information to the secretariat, preferably in English, or another official language of the United Nations. Additionally, Parties may provide references to additional relevant background information in an annex to the national communication.⁴

8. To facilitate transparency, comparability, and consistency of national communications, Parties should (shall) structure their national communication following the outline contained in the annex to these guidelines. To ensure completeness, no mandatory element shall be excluded. If mandatory elements cannot be reported for any reason, Parties should (shall) explain the omission or the reason for partial reporting in the section relating to that element.

9. Where statistical data are provided they should be accompanied by a definition of terms, unless they are obvious. These should (may) be included in footnotes or as an annex to the national communication.⁵

II. EXECUTIVE SUMMARY

10. A national communication shall include an executive summary that summarizes the information and data from the full document. The executive summary shall be of no more than 15 pages.

III. NATIONAL CIRCUMSTANCES

11. This section shall provide a description of a Party's general national circumstances, how national circumstances affect overall and/or relative GHG emissions and how national circumstances affect GHG emissions over time. It should allow the reader to understand the

³ Paragraph 5 has been amended to request that Parties provide 500 copies of their national communication, in line with existing practice, and also provide a full electronic version, not just the tables.

⁴ The request to supply references is new in order to provide readers and not just the secretariat with information about additional publications.

⁵ Paragraph 9 has moved from the "National circumstances" section because it is relevant throughout the national communication.

relevance of national circumstances to GHG emissions. Information shall be provided relevant to the three aspects described in sections A - C below.

A. General national circumstances

12. The Party shall provide information about its general national circumstances which may include:

- (a) Size and geographic features of the country;
- (b) Government structure.

B. National circumstances relevant to absolute and/or relative GHG emissions

13. The Party shall provide information which assists the reader in understanding the scale of absolute GHG emissions and/or relative GHG emissions. The Party should provide indicators such as emissions per unit of output or per capita and/or more disaggregated indicators to explain relative emissions and/or the relationship between national circumstances and emissions. The Party should provide information about how its national circumstances are relevant to factors affecting GHG emissions such as travel distances, heating requirements, renewable energy potential, land use and energy balance. National circumstances in this context may include:⁶

- (a) Population profile: [For example, total population, growth rate, density and distribution, with trends since 1990];
- (b) Geographic profile: [For example, area, latitude, land-use pattern, and ecosystems];
- (c) Climate profile: [For example, temperature distributions, heating and cooling degree days, rainfall distributions, variability and extreme events];
- (d) Economic profile: [For example, gross domestic product (GDP), GDP per capita (expressed in domestic currency and purchasing parities), GDP by sector, international trade patterns, with trends since 1990];
- (e) Energy profile: [For example, energy resources profile, energy supply by fuel (million tonnes oil equivalent), energy prices, energy market structures (oil, gas, coal, hydro,

⁶ Parties may note that the projections section requests information about key activity data underlying emission trends over time such as the number of cars or deep landfills. Information in this section may be limited to that which illustrates the link between national circumstances and activities related to GHG emissions and/or directly to GHG emissions.

renewables, nuclear), energy consumption patterns, intensity by sector and trade in energy commodities, including electricity];

(f) Transport: [For example, features of transport infrastructure (road, rail, sea, air and public transport), and vehicle fleet size (cars and commercial)];

(g) Industry and waste: [For example, industry structure, trends and waste management practices];

(h) Building stock and urban form: [For example profile of residential buildings (type and occupancy), profile of commercial buildings, urban density and structure];

(i) Agriculture: [For example, structure, trends and waste management practices];

(j) Forestry: [For example, structure, trends];

(k) Other circumstances.

C. National circumstances relevant to changes in emissions over time

14. The Party shall provide information about changes in national circumstances over time (for example since 1990 or since the publication of the previous national communication) which will assist the reader in understanding changes in GHG emissions. The Party should present an analysis of the relationship between changes in energy consumption or GHG emissions and changes in underlying national circumstances over time. National circumstances in this context may include:

- (a) GDP change;
- (b) Annual temperature variation;
- (c) Annual cross-border electricity trade;
- (d) Change in industrial structure;
- (e) Other.

D. Flexibility in accordance with Article 4.6 and 4.10

15. Parties requesting flexibility or consideration, in accordance with Article 4.6 and 4.10 of the Convention, shall state the type of special consideration they are seeking and provide an adequate explanation of their circumstances.

IV. GREENHOUSE GAS INVENTORY INFORMATION

A. Summary tables

16. Summary information from the national greenhouse gas inventory prepared according to part I of these guidelines shall be provided for the period from 1990 (or other base year) to the last but one year prior to the year of submission of the national communication (e.g. inventory information up to the year 1999 shall be provided in the third national communication to be submitted by 30 November 2001). The information provided in the national communication should be consistent with that provided in the annual inventory information submission of the year in which the national communication is submitted.

17. For the purpose of the national communication, complete inventory information need not be provided. However, at a minimum, Parties shall report the summary, including CO₂ equivalent and emissions trend tables given in the common reporting format contained in the above-mentioned guidelines. These tables may be provided as an annex to the national communication rather than in the main text.

B. Descriptive summary

18. In the main text of the national communication, Parties shall provide a descriptive summary and shall provide a diagram for each GHG reported in the summary tables, showing unadjusted emissions for the period 1990, or from another base year, approved by the COP, in accordance with Article 4.6 of the Convention, to the latest year available, in accordance with paragraph 16 above.

V. POLICIES AND MEASURES⁷

A. Selection of policies and measures for the national communication

19. Article 12.2 requires Annex I Parties to communicate information on policies and measures adopted to implement commitments under Article 4.2(a) and (b). These need not have the limitation and reduction of GHG emissions as a primary objective.

20. In reporting, Parties should give priority to policies, or combinations of policies, which have the most significant impact in limiting or reducing GHG emissions and may also indicate those which are innovative and/or effectively replicable by other Parties.⁸ Parties may report implemented policies and those in the planning stage, but the distinction between the two must

⁷ The heading 'Mitigation plans' has been deleted and the sub-heading 'Policies and measures' retained.

⁸ Parties may wish to note decision 8/CP.4, which relates to the exchange of information about 'best practices', and that the guidelines may be updated accordingly.

be clear throughout.⁹ The national communication does not have to report every policy and measure which affects GHG emissions.

21. Policies reported on should (could) be those decided and/or implemented by governments at national and local level. Furthermore, policies reported may (could) also include those adopted in the context of regional or international efforts.

22. Parties shall report policies and measures which encourage activities leading to greater levels of GHG emissions than otherwise, identified in accordance with Article 4.2(e) of the Convention. These may (could) include subsidies to fossil fuel production and consumption or livestock rearing. In addition, policies relating to security of fuel supply may be of relevance in this context.

B. Structure of the policies and measures section of the national communication

23. Parties shall organize the reporting of policies and measures by sectors, subdivided by GHG (CO₂, CH₄, N₂O, HFCs, PFCs, SF₆). Each sector shall (should) have its own textual description of the principal policies and measures, as set out in section D below, supplemented by summary table 1.¹⁰ Parties may include separate text and a table describing cross-sectoral policies and measures.

24. In cases where a policy or measure has been maintained over time and is thoroughly described in the Party's previous national communication, reference should be made to this and only a brief description contained in the latest national communication, focusing on any alterations to the policy or effects achieved.

25. Some information such as the effect of policies and measures may be presented in aggregate for several complementary measures in a particular sector or affecting a particular gas.

C. Policy-making process

26. The national communication shall (should) describe the overall policy context including national targets for greenhouse gas mitigation, in addition to Convention commitments. Strategies for sustainable development or other relevant policy objectives may also be covered. Relevant inter-ministerial decision-making processes or bodies may (should) be noted.

⁹ A sentence is added to note that Parties may provide information about implemented policies and those in the planning stage, to be consistent with paragraph 29, sub-item (e).

¹⁰ The term 'plus' has been replaced with 'supplemented by' to clarify that the table is secondary to the textual description of policies and measures.

27. The national communication shall (should) provide a description of the way in which progress with policies and measures to mitigate GHG emissions is monitored and evaluated over time. Institutional arrangements for monitoring of GHG mitigation policy shall (should) also be reported in this context.¹¹

D. Policies and measures and their effects

28. Parties shall (should) provide information on how they believe their policies and measures are modifying longer-term trends in anthropogenic emissions consistent with the objective of the Convention.

29. The description of each policy and measure shall include information on each of the subject headings listed below. The description should (shall) be concise and should (could) include information on the detail suggested after each subject heading.

(a) *Name of the policy or measure.*¹²

(b) *Objectives of the policy or measure.* The description of the objectives should focus on the key purposes and benefits of the policies and measures. Objectives should be described in quantitative terms, to the extent possible.¹³

(c) *The greenhouse gas or gases affected.*

(d) *Type or types of policy or measure.* Use, to the extent possible, the following terms: economic, fiscal, voluntary, regulatory, information, education, research, other.¹⁴

(e) *Status of implementation.* It should be noted whether the policy or measure is in the planning stage or is under legislative consideration, or whether a legislative decision (or decision by another relevant body) has been taken. For policies having been decided by the relevant authority, the stage of implementation they are at should be noted. Information may include the funds already provided, future budget allocated and the planned time-frame for the implementation of the policy or measure;

¹¹ This was formerly a sub-item under paragraph 30, but it does not need to be described for each policy.

¹² Sub-item (a) is new in order to be consistent with table 1.

¹³ Parties may wish to note that table 1 does not have a column in which Parties may indicate the activity affected by the policy (i.e. the objective under paragraph 29, sub-item (b)) and may wish to amend it accordingly. For clarity, Parties may also wish to use the term 'activity' in the description of 'objectives'.

¹⁴ Parties may wish to note that the terms 'economic' and 'fiscal' may be difficult to distinguish and that 'research' may be the result of a policy. Parties may wish to consider alternative terms. (Parties may wish to note that the terms 'tax', 'subsidy', 'voluntary agreement', 'regulation', 'public education' and 'specialist training' were used in the secretariat's questionnaire to Parties about the new gases.)

(f) *Level of government and private sector involvement.* This should cover whether a central or local government decision is or was required to initiate the policy, whether funds are provided from state or local budgets and who is the implementing authority. It should (shall) also cover whether the policy is targeted at the organization, firm or household level etc. and, where possible, note the scale of private sector involvement in terms of funding etc.

30. The following information [may] [shall] [should] be included in the description of each policy and measure reported: (*Parties may note that if the word 'shall' is adopted, then paragraph 30 can be deleted and these points can continue as sub-items of paragraph 29.*)

(a) *A quantitative estimate of the impacts of individual policies and measures or collections of policies and measures.* The estimate may be of historic impacts and/or of future impacts. This may be in terms of the underlying activity or emissions affected, compared to the likely level of activity or emissions for the relevant sector in the absence of such policies. This information should be presented as an estimate for a particular year such as 1995, 2000 and 2005, not for a period of years. Parties may also (are also encouraged to) provide a brief description of how such savings are estimated. This information may be provided for both implemented policies and measures and policies and measures under consideration, but the distinction between the two should be clear.¹⁵

(b) *Information about the costs of policies and measures.* Such information should be accompanied by a brief definition of the term 'cost' in this context.

(c) *Information about non-GHG mitigation benefits of policies and measures.* Such benefits may (could) include, for example, reduced emissions of other pollutants or health benefits.

(d) *How the policy or measure interacts with other policies and measures at the national level.* This may include a description of how policies complement each other in order to enhance overall greenhouse gas mitigation.

E. Policies and measures no longer in place

31. When policies listed in previous national communications are no longer in place, Parties may explain why this is so.¹⁶

¹⁵ Parties may wish to note that, according to paragraph 23, table 1 shall be completed, but that according to footnote f of table 1, information on the quantified estimate of impacts shall (should) only be provided 'to the extent possible'.

¹⁶ The sentence was part of paragraph 24. It has not been changed, but is shown as a separate paragraph because it is a distinct point.

Table 1.¹⁷ Summary of policies and measures by sector^a

Name of policy/ measure ^b	GHG affected	Type of instrument ^c	Status of implementation ^d	Level of government and private sector involvement ^{e,18}	Estimate of mitigation impact, by gas ^f (for a particular year, not cumulative, in CO ₂ equivalents)				
					1995	2000	2005	2010	2020

^a Separate tables shall (should) be completed for each sector. To the extent appropriate, the following sectors should be considered: energy, transport, industry, agriculture, forestry and waste management. A table may (could) also be completed for any cross-sectoral policies and measures.¹⁹

^b Parties should use an asterisk (*) to indicate that a measure is included in the 'with measures' projection.

^c To the extent possible the following terms should be used: economic, fiscal, voluntary, regulatory, information, education, research and other.

^d To the extent possible the following descriptive terms should be used: under consideration, decided (year), implemented (year),

funding allocated (years, amount), funding planned (years, amount), expected end date (year).

^e For example, central government or federal authority, private sector, county, municipality.

^f This information shall (should) be included to the extent possible, and where appropriate, taking into account the appropriate level of aggregation.

¹⁷ Parties may wish to note that this table excludes sub-item (b) of paragraph 29, so it does not cover the activity (i.e. the objective) affected by the policy or measure described. They may wish to amend the table accordingly.

¹⁸ The heading of this column, formerly 'Implementing entity or entities', has been changed in order to make it consistent with paragraph 29, sub-item (f). Parties may, however, prefer to retain the original heading and change sub-item (f) in order to achieve consistency.

¹⁹ In footnote a, the sectors for which Parties are requested to report policies and measures are now in line with the six sectors mentioned in the Convention.

VI. PROJECTIONS AND THE TOTAL EFFECT OF POLICIES AND MEASURES

A. Purpose

32. The primary objective of the projections section of the national communication is to give an indication of future trends in GHG emissions and removals, given current national circumstances and implemented policies and measures, and to give an indication of the path of emissions without such policies and measures.

B. Projections

33. At a minimum, Parties shall report a 'with measures' projection, in accordance with paragraph 34 and may report 'without measures' and 'with additional measures' projections.

34. A '**with measures**' projection shall encompass currently implemented policies and those not yet implemented by the Party at the time of preparation of the national communication, but fully committed to through, for example, legislation. If provided, a '**with additional measures**' projection shall also encompass policies and measures not yet implemented, but under consideration and with a realistic chance of being implemented. If provided, a '**without measures**' projection shall include all policies and measures implemented prior to the year chosen as the starting point for this projection.

35. Parties may report sensitivity analysis for any of the projections, but should aim to limit the number of scenarios presented.

C. Presentation of projections relative to actual data

36. Emission projections shall be presented relative to actual inventory data for the preceding years.

37. For the 'with measures' and 'with additional measures' projections, the starting point should generally be the latest year for which inventory data are available in the national communication. For the 'without measures' projection, the starting point may be 1995 or Parties may provide a 'without measures' projection starting from an earlier year such as 1990 or another base year, as appropriate.

38. Parties may use temperature-adjusted energy data or other 'normalized' data in making their projections. However, Parties should present their projections relative to unadjusted inventory data for the preceding years. In addition, Parties may present their projections relative to adjusted inventory data. In this case, Parties shall explain the nature of the adjustments.

D. Coverage and presentation

39. Projections shall be made on a gas-by-gas basis for the following greenhouse gases: CO₂, CH₄, N₂O, PFCs, HFCs and SF₆ (treating PFCs and HFCs collectively in each case). [Parties may also provide projections of the indirect greenhouse gases CO, NO_x and NMVOCs, as well as SO_x.] In addition, projections shall be provided in an aggregated format, using GWP values agreed upon by the Conference of the Parties.

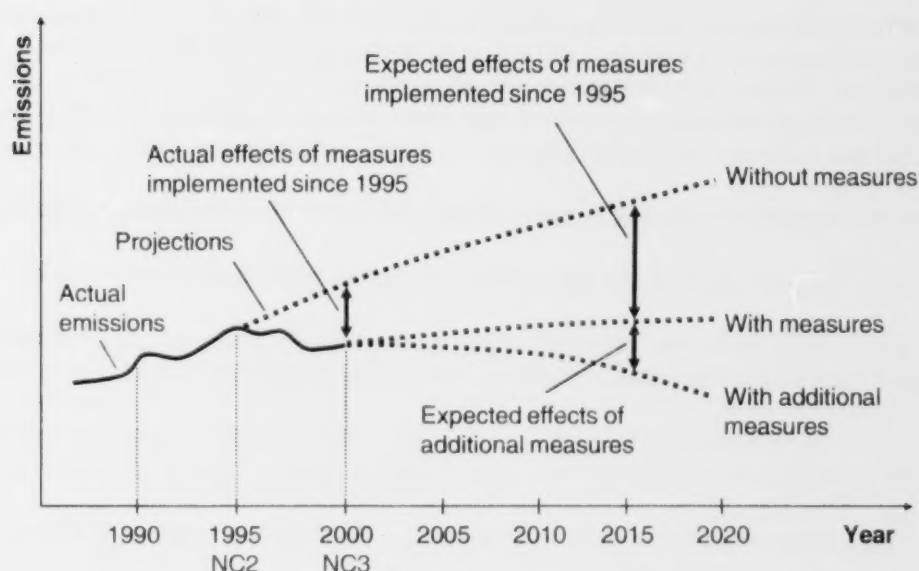

40. Projections should (shall) be further subdivided on a sectoral basis, to the extent possible using the same sectoral categories used in the policies and measures section. This subdivision should (shall) include a separate category for land-use, land-use change and forestry.

41. To ensure consistency with inventory reporting, emissions from fuel sold to ships and aircraft engaged in international transport should (shall) be reported separately and not included in the totals.

42. In view of the objective of the Convention and the intent to modify longer-term trends in emissions and removals, Parties should (shall) include projections on a quantitative basis for the years 2005, 2010, 2015 and 2020. Projections should (shall) be presented in a tabular format by gas and sector for each of these years, together with actual data for the period 1990 to 2000 or the latest year available. For Parties using a different base year for their inventories, in accordance with Article 4.6. and 4.10 of the Convention, actual data for that year shall be given.

43. At a minimum, a diagram for each gas shall be presented showing unadjusted inventory data and a 'with measures' projection, for the period 1990 (or another base year, as appropriate) to 2020. Additional diagrams may also be presented. Figure 1 illustrates the presentation of a hypothetical Party's projection for a single gas. It shows unadjusted inventory data for the period 1990 to 2000. It shows 'with measures' and 'with additional measures' scenarios starting from 2000, and a 'without measures' scenario starting from 1995.

Figure 1: Hypothetical Party's projection for emissions of one gas

E. Assessment of effects of policies and measures

44. The estimated effects of individual policies shall be described in the policies and measures section of the national communication. In the projections section of the national communication, Parties shall present the estimated total effect of implemented policies and the total expected effect of implemented policies and may also present the total expected effect of additional policies and measures.

45. Parties shall provide an estimate of the total effect of their policies and measures, in accordance with the 'with measures' definition, compared to a situation without such measures. This effect shall be presented in terms of GHG emissions saved, by gas (on a CO₂ equivalent basis), in particular years such as 1995, 2000, 2005, 2010, 2015 and 2020 (not cumulative savings). This information may be presented in tabular format.

46. Parties may calculate the total effect of their measures by taking the difference between a 'with measures' and 'without measures' projection. Alternatively, Parties may use another approach to individually assess the effect of each significant policy and measure, aggregating the individual effects to arrive at a total. In either case, when reporting, it should be clear from what year onward it is assumed that policies are implemented or not implemented in making the calculations.

F. Methodology

47. When projecting greenhouse gas emissions and removals, and estimating the total effects of policies and measures on emissions and removals, Parties may use any models and/or approaches they choose. Sufficient information should be reported in the national communication to allow a reader to obtain a basic understanding of such models and/or approaches and additional information shall be available for purposes of review.

48. In the interests of transparency, for each model or approach used, Parties should (shall):

- (a) Explain which gases and/or sectors the model or approaches were used for;
- (b) Describe the type of model or approach used and its characteristics (for example, top-down model, bottom-up model, accounting model, expert judgement);
- (c) Describe the original purpose the model or approach was designed for and, if applicable, how it has been modified for climate change purposes;
- (d) Summarize the strengths and weaknesses of the model or approach used;
- (e) Explain how the model or approach used accounts for any overlap or synergies that may exist between different policies and measures.

49. To ensure transparency, Parties should (shall) report information about key underlying assumptions and values of key variables such as GDP growth, population growth, tax levels and international fuel prices, using table 2. This information should be limited to that which is not covered under section G, i.e. it should not include sector-specific data.

Table 2. Summary of key variables and assumptions in the projections analysis

	Historic			Projected ²⁰				
	1985	1990	1995	2000	2005	2010	2015	2020
Variable 1 (e.g. GDP growth)								
Variable 2 (e.g. world oil prices (US\$/barrel))								

²⁰ Parties may indicate with an asterisk where the data is not an output but has been assumed as an input to the emission projections.

50. Parties should report the main differences in the assumptions, methods employed, and results between projections in the current national communication and those in earlier national communications.
51. The level of uncertainty associated with the projections and, where relevant, uncertainty associated with underlying assumptions should (shall) be discussed qualitatively and, where possible, quantitatively.
52. Parties are encouraged to have their projections peer-reviewed by independent experts.

G. Summary of key data relevant to projections

53. Parties shall present information about the expected profiles of various sectors, using key data, *inter alia*, as suggested below, giving information for the years 1990 to 2020, at five-year intervals, where available. The objective is to provide the reader with an understanding of the key factors and activities underlying emission trends over time. This information may be presented in a tabular format.²¹

Actual and future energy sector profile

- (a) Primary energy production by fuel type;
- (b) Energy demand by sector;
- (c) Energy imports/exports.

Actual and future industrial sector profile

- (a) Absolute output by industry sector (in US dollars);
- (b) Output* as a share of total GDP, by sector (in US dollars).

Actual and future transport sector profile

- (a) Cars per thousand of population;
- (b) Passenger-kilometres by type i.e. road, rail, air, sea;
- (c) Freight-kilometres and tonne-kilometres.

Actual and future agricultural sector profile

- (a) Arable land area;
- (b) Livestock numbers, by animal type;

²¹ Parties may indicate with an asterisk where the data is not an output but has been assumed as an input to the emission projections.

- (c) Rice cultivation (area cultivated in hectares);
- (d) Fertilizer consumption.

Actual and future waste sector profile

- (a) Number of deep landfills;
- (b) Number of shallow landfills;
- (c) Number of landfills with CH₄ recovery and flaring;
- (d) Number of landfills with energy production;
- (e) Landfill waste disposal (tonnes).

Actual and future forestry sector profile

- (a) Area of afforestation and reforestation (thousands of hectares);
- (b) Area of deforestation.

Actual and future residential and commercial buildings sector profile²²

- (a) Number of households with coal/ gas/ wood/ geothermal and electric heating;
- (b) Average heat loss per m² of floor area.

VII. VULNERABILITY ASSESSMENT, CLIMATE CHANGE IMPACTS AND ADAPTATION MEASURES

54. A national communication shall include information on the expected impacts of climate change and an outline of the actions taken to implement Article 4.1(b) and (e) with regard to adaptation. Parties are encouraged to use the IPCC Technical Guidelines for Assessing Climate Change Impacts and Adaptations and the United Nations Environment Programme (UNEP) Handbook on Methods for Climate Change Impacts Assessment and Adaptation Strategies.²³ Parties may refer, *inter alia*, to integrated plans for coastal zone management, water resources and agriculture. Parties may also report on specific results of scientific research in the field of vulnerability assessment and adaptation.

²² If Parties wish to maintain only the six economic sectors listed in the Convention, then the 'buildings sector' could be categorized under the 'energy sector' profile.

²³ This reference has been added to the UNEP Handbook in accordance with the conclusions of the SBSTA at its tenth session (FCCC/1999/SBSTA/6, paragraph 55).

VIII. FINANCIAL RESOURCES AND TRANSFER OF TECHNOLOGY

55. In accordance with Article 12.3, Annex II Parties shall provide detailed information on the activities undertaken to give effect to their commitments under Article 4.3, 4.4, and 4.5, as follows.
56. Parties shall indicate what "new and additional" financial resources have been provided, to meet the agreed full costs incurred by developing country Parties, in complying with their obligations under Article 12.1. Parties shall clarify how they have determined such resources as being "new and additional" in their national communications.
57. Parties shall provide information on the provision of financial resources to meet the agreed full incremental costs incurred by developing countries in their implementation of measures covered under Article 4.1 of the Convention. When communicating this information, Parties shall complete tables 4 and 5 below.
58. Parties shall provide detailed information on the assistance provided for the purpose of assisting developing country Parties that are particularly vulnerable to the adverse effects of climate change in meeting the costs of adaptation to those adverse effects, in textual format and with reference to table 5 below.
59. Parties shall, when reporting activities related to the promotion, facilitation and financing of the transfer of, or access to, environmentally sound technologies, clearly distinguish between activities undertaken by the public sector and those undertaken by the private sector. As the ability of Parties to collect information on private sector activities is limited, Parties may indicate, where feasible, in what way activities by the private sector help meet the commitments of Parties under Article 4.3, 4.4 and 4.5 of the Convention.
60. Parties shall report on some significant success stories related to technology transfer, using table 6 below. Parties shall also report their activities for financing access by developing countries to "hard" or "soft" environmentally sound technologies.²⁴
61. Parties are encouraged to report, in textual format, information on steps taken by governments to promote, facilitate and finance transfer of technology, and to support development and enhancement of endogenous capacities and technologies of developing countries.

²⁴ The term "transfer of technology", as used here, encompasses practices and processes such as "soft" technologies, for example, capacity-building, information networks, training and research, as well as "hard" technologies, for example, equipment to control, reduce or prevent anthropogenic emissions of greenhouse gases in the energy, transport, forestry, agriculture, and industry sectors, to enhance removals by sinks, and to facilitate adaptation.

Table 3. Financial contributions to the Global Environment Facility (GEF) and other multilateral institutions and programmes²⁵

Institution or programme	Contributions ²⁶ (millions of US dollars)

IX. RESEARCH AND SYSTEMATIC OBSERVATION²⁸

62. Pursuant to Articles 4.1(g), 5 and 12.1(b), Annex I Parties shall communicate information on their actions relating to research and systematic observation.²⁹

63. In preparing their communications on systematic observation and related data and monitoring systems, Parties may be guided by the draft guidance for reporting on global climate observing systems from the Global Climate Observing System secretariat.³⁰

64. The national communication shall (should) address both domestic and international activities (for example, the World Climate Programme, the International Geosphere-Biosphere Programme, GCOS, and the IPCC). They shall also reflect actions taken to support related capacity-building in developing countries.

65. The national communication should (shall) be limited to reporting on actions undertaken and the opportunities for and barriers to international exchange of data and information, rather than the detailed results of such efforts. For example, the results of research studies or model runs or data analysis should (shall) not be included in this section.

A. General policy and funding of research and systematic observation

66. Parties should provide information about general policy and funding of research and systematic observation.³¹

67. Parties should identify the opportunities for and barriers to free and open international exchange of data and information.

²⁸ The European Union and United States text contained in Working Paper No. 4 has been retained in this section, with some changes in paragraph order.

²⁹ Parties may wish to consider providing a separate report on research and systematic observation in order to limit the volume of the national communication and to have the opportunity to describe more fully activities on this subject.

³⁰ A reference to the GCOS guidelines is made in accordance with the conclusions of SBSTA at its tenth session (FCCC/SBSTA/1999/6, paragraph 75).

³¹ This sentence is new, to allow Parties to provide a general context for the section.

B. Research

68. Parties shall provide, *inter alia*, information on:
- (a) Climate process and climate system studies;
 - (b) Modelling and prediction, including general circulation models;
 - (c) Research on the impacts of climate change;
 - (d) Socio-economic analysis, including analysis of both the impacts of climate change and response options;
 - (e) Technology research and development.

C. Systematic observation and monitoring systems

69. Parties shall provide information on the current status of national plans and support in the following areas:
- (a) Atmospheric observing systems, including those measuring atmospheric constituents;
 - (b) Ocean observing systems;
 - (c) Terrestrial observing systems, including those dealing with land-surface properties, ice masses and freshwater resources;
 - (d) Support for developing countries to establish and maintain observing systems and related data and monitoring systems.

X. EDUCATION, TRAINING AND PUBLIC AWARENESS

70. In accordance with Articles 4.1(i), 6 and 12.1(b), Annex I Parties shall communicate information on their actions relating to education, training and public awareness. In this section, Parties should (shall) report, *inter alia*, on public information and education materials, resource or information centres, training programmes, and participation in international activities. Parties may (are encouraged to) report the extent of public participation in the preparation or domestic review of the national communication.

71. The national communication may present information such as:³²

- (a) General policy toward education, training and public awareness;
- (b) Primary, secondary and higher education;
- (c) Public information campaigns;
- (d) Training programmes;
- (e) Resource or information centres;
- (f) Involvement of the public and non-governmental organizations;
- (g) Participation in international activities.

XI. SYSTEMATIC UPDATING OF THE GUIDELINES

72. Any future decisions taken by the Conference of the Parties regarding the reporting of information under the Convention shall (should) be applied *mutatis mutandis* to this part i.e. part II of the guidelines.

³² Paragraph 71 has been added to provide some structure to the education, training and public awareness section of the national communication.

**Annex to the Chairman's revised draft text of the guidelines for the
preparation of national communications by Parties included in
Annex I to the Convention**

STRUCTURE OF THE NATIONAL COMMUNICATION

SUBSIDIARY BODY FOR SCIENTIFIC AND TECHNOLOGICAL ADVICE
Eleventh session
Bonn, 25 October - 5 November 1999
Item 8 (a) of the provisional agenda

**NATIONAL COMMUNICATIONS FROM PARTIES INCLUDED
IN ANNEX I TO THE CONVENTION**

GUIDELINES FOR THE PREPARATION OF NATIONAL COMMUNICATIONS

**Guidelines for the preparation of national communications by Parties
included in Annex I to the Convention: Part II**

Addendum

**STATUS OF THE CHAIRMAN'S DRAFT TEXT AT THE CLOSE
OF THE TENTH SESSION**

Note by the secretariat

1. The Subsidiary Body for Scientific and Technological Advice (SBSTA), at its tenth session, concluded that discussions on revisions to part II of the guidelines for the preparation of national communications by Parties included in Annex I to the Convention, should continue at its eleventh session. It requested the secretariat to prepare a document reflecting the status of discussions on the draft text of part II of the guidelines at the close of the tenth session (FCCC/SBSTA/1999/6, para. 27 (h)).
2. The annex to this note contains a draft text as it stood at the end of discussions held in the joint contact group convened at the tenth session of the SBSTA. It thus responds to the above mandate. The text incorporates the revisions proposed by Parties as of the close of the meeting of the joint contact group on 11 June 1999. The annex also contains proposals made by Parties and the co-Chairs to the joint contact group at the 10th session of the SBSTA.
3. Paragraphs 1-32 of the draft text were discussed by the joint contact group at the tenth session of the SBSTA. The remaining paragraphs, 33 - 60, were not discussed by the group. In

GE.99-65909

proposals submitted by Parties, deletions are indicated by ~~strikeout~~ and proposed additions by [brackets].

4. To reflect the state of discussions with respect to the mandatory and optional elements of the guidelines, the words *shall*, *should*, *could* and *mandatory* have been placed in [brackets], as the contact group proposed they be reviewed for consistency with the requirements of the Convention and previous decisions of the Conference of the Parties.

Annex I

**TEXT REFLECTING THE STATUS OF DISCUSSIONS AT THE TENTH SESSION OF
THE SBSTA ON DRAFT GUIDELINES FOR THE PREPARATION OF NATIONAL
COMMUNICATIONS BY PARTIES INCLUDED IN ANNEX I TO THE CONVENTION:**

Part II: National Report

Working Paper No. 4

I. INTRODUCTION

A. Objectives

1. The objectives of these guidelines for preparing the national communication are:
 - (a) To assist Annex I Parties in meeting their commitments under Articles 4 and 12 of the Convention;
 - (b) To promote the provision of consistent, transparent, comparable, accurate and complete information in order to enable a thorough review and assessment of the implementation of the Convention by the Parties, and to monitor the progress they are making towards meeting the goals of the Convention; and
 - (c) To ensure that the Conference of the Parties (COP) has sufficient information, in accordance with Article 4.2(d), to carry out its responsibilities to review the implementation of the Convention and the adequacy of the commitments in Article 4.2(a) and (b).

B. Definitions

2. In the context of these guidelines:

The joint contact group decided to return to the question of which [if any] terms need definition once it has completed consideration of the entire text and taking into account the definitions already included in part I of the guidelines.

Implemented policy or measure means

Transparency means

Consistency means

Comparability means

Completeness

Accuracy

(more terms to be specified)

The European Union (EU), in its submission to the group, suggested the following definitions:

"Implemented policy or measure" means a policy or measure in respect of which one or more of the following applies: (a) national legislation is in force; (b) one or more voluntary agreements have been established; (c) financial resources have been allocated; (d) human resources have been mobilized.

Transparency means that the text of the national communication is intelligible in terms of national actions and circumstances. Full *transparency* means that the quantitative and qualitative results could be reconstructed by a second Party on the basis of the information provided. In practical terms the amount of information that a Party would have to provide in order to achieve full transparency would be very great. However a Party would normally be expected to have access to the necessary information to provide full *transparency* if needed in some areas for review purposes.

Consistency means that data, sectoral definitions, calculation methods and technical terms which are used in the national communication, or which occur both in the national communication and national inventories, have the same values, definitions, or significance wherever they occur, and that any associated time-series are calculated on the same basis throughout.

Comparability means that methodologies agreed by the Parties have been used, for example to estimate greenhouse gas inventories, and that other internationally agreed definitions and methodologies have been employed."

C. Coverage

3. In accordance with Articles 4.1(j) and 12.1(a) and (b), a communication [shall] describe the actions by Annex I Parties that significantly contribute to the implementation of their Convention obligations. In accordance with Article 12.3, Annex II Parties [shall] also report on finance and technology transfer measures to implement Article 4.3, 4.4 and 4.5.

4. In accordance with Articles 4 and 12, and consistent with part I of the reporting guidelines, a communication [shall] describe anthropogenic emissions by sources and removals by sinks of all greenhouse gases (GHGs) not controlled by the Montreal Protocol. At a minimum, this communication [shall] contain information on the following six greenhouse gases: carbon dioxide (CO₂), methane (CH₄), nitrous oxide (N₂O), perfluorocarbons (PFCs), hydrofluorocarbons (HFCs), and sulphur hexafluoride (SF₆). The communication [should] provide information on any other greenhouse gases whose 100-year global warming potential (GWP) values have been identified by the Intergovernmental Panel on Climate Change (IPCC) and adopted by the COP. The communication [should] also provide information on the following indirect greenhouse gases: carbon monoxide (CO), nitrogen oxides (NO_x) and

non-methane volatile organic compounds (NMVOCs). Parties are also encouraged to provide information on sulphur oxides (SO_x) in their national communications.

D. Structure

5. The information identified in these guidelines [shall] be communicated by a Party to the Conference of the Parties in a single document submitted in one of the official languages of the United Nations. The length of a communication may be decided by the submitting Party but every effort [should] be made to avoid over-lengthy communications, in order to reduce the paper burden and to facilitate the consideration process. Parties [shall] provide electronic version of the [mandatory] tables in the format required.
6. To facilitate transparency, comparability, and consistency of national communications, Parties [shall] structure this document following the outline in the annex. To ensure completeness, no [mandatory] element [shall] be excluded. If [mandatory] elements cannot be fully reported for any reason, Parties [shall] explain the omission or the reason for partial reporting in the section relating to that element.
7. Parties are encouraged to provide additional relevant background information, preferably in English, or another official language of the United Nations.
8. Annex I Parties are also encouraged to submit, where relevant, a translation of their communication into English.

II. EXECUTIVE SUMMARY

9. A communication [shall] include an executive summary that summarizes the [mandatory] information and data from the full document. In view of the limits on translation, the executive summary [shall] be of no more than 15 pages.

III. NATIONAL CIRCUMSTANCES

10. This section [should] provide the context for the information presented in the national communication about a Party's implementation of the Convention. It [should] assist the reader in understanding observed trends in greenhouse gas emissions, the choice of different policies and measures and future emission trends. Information [should] be provided for a sufficient time period to allow the reader to understand its relevance to information given elsewhere in the national communication. Parties may explain the link between their national circumstances and observed emission trends, their policies and measures and other aspects of information in the national communication, in the relevant sections.
11. Information [shall] be provided for each of the subject headings listed below. Parties may provide whatever information best describes their own national circumstances for each of the subject headings. However, to improve the comparability of information in national

communications, for each subject heading, relevant types of information and time periods are suggested. Where such information has been provided in earlier national communications, this can simply be noted in the latest national communication where this simplifies reporting.

[The contact group discussed several options for the sub-sections (a) to (f) of paragraph 11, based on the text of the existing guidelines, one based on the existing draft text below, and one based on the shortened version produced by Australia which is identified below.

(a) Population profile: Total population, population density and dispersal. Total greenhouse gas emissions [per capita] (CO_2 , CH_4 , N_2O , HFCs, PFCs, SF_6), measured on a CO_2 equivalent basis. (Provide data for 1990, or the relevant base year, to latest available year.);

(b) Geographic profile: Total land area in km^2 , latitude of most southerly and northerly points, continent. Proportion of land devoted to agriculture, forest (indicating the proportion of managed to unmanaged), dwellings, etc. (Provide data for the most recent year available.);

(c) Climatic profile [and trends]: Parties [should] provide key climatic data, for example, average winter and summer temperature and precipitation in the region or regions of highest population density such as the capital. Average number of heating and/or cooling degree days [for the most recent averaging period agreed to by the World Meteorological Organization (WMO)] [(climate statistics [should] be used.)] (Statistics may be based on an average of recent years.);

(d) Government structure: A description of the government structure, including the number of underlying bodies at regional levels such as state, county or municipality level, and their role in determining policy and/or implementing policies and measures, in general; [(Information presented here [could] include regulation and responsibility for measurement of GHG emissions, if not included under subparagraph (i))]

(e) Economic profile: Gross domestic product (GDP) and [GDP per capita] expressed in local currency, in nominal and real terms. [GDP can be expressed, additionally, on purchasing power parity basis.] GDP by sector such as agriculture, industry, services. (Provide data for 1990, or the relevant base year, to the latest available year.) A description of major economic changes or shifts between sectors such as a significant decline or growth in manufacturing activity and the main reasons behind such changes. A description of state support to different economic activities such as energy production [, and transport, industry,] agriculture [forestry] and any significant changes over time to such support. (Statistics on subsidies may also be provided and may be based on own definitions or Organisation for Economic Co-operation and Development (OECD) definitions of producer subsidy equivalent, etc.) For different sectors additional information may be provided which may assist in explaining emission trends such as livestock numbers or numbers of landfills since 1990, or the relevant base year;

(f) Energy profile: Energy balance in terms of primary energy supply by fuel, in million tonnes of oil equivalent (Mtoe). Energy consumption by sector, for example, industry, households, transport, electricity generation, in Mtoe. Electricity generating capacity by source, for example oil, gas, hydro, renewables, coal, nuclear, in MW. Electricity generation by source, in TWh. Imports and exports of electricity in TWh. [Energy intensity measured as total primary energy supply per unit of GDP. Total primary energy supply per capita.] The real delivered price of energy and electricity to different consumer groups such as large, medium and small industrial consumers and households. (Provide data for 1990, or the relevant base year, to the most recent year available.) A description of the market structure and any major changes since 1990, or the relevant base year, such as market liberalization. This may also cover a description of the infrastructure such as degree of coverage of the national gas distribution network. Domestic energy reserves, including economically recoverable coal, oil and gas reserves, uranium and hydropower resources, and the economic potential for renewable energy. Opportunities for barriers to fuel switching for different sectors or groups of consumers;

(g) Transport: Fleet numbers of cars and heavy goods vehicles. Passenger and freight kilometres by rail, road, sea and air. (The statistics may make a distinction between passenger-kilometres travelled by public and private transportation.) Average number of passenger cars per hundred of population. (Provide data for 1990, or the relevant base year, to the most recent year available.) A description of the road and rail infrastructure [A description of state support to different forms of transportation and any significant trends];

(h) Housing stock: Dwelling numbers by type, for example, detached houses, flats. Average dwelling size. Occupancy rate. (Data for the most recent year available.) Commentary on age of housing stock and on extent of new housing being built, if significant;

(i) [Monitoring of greenhouse gas mitigation]: A description of the way in which progress with policies and measures to mitigate greenhouse gas emissions is monitored and evaluated. Parties may include information about indicators which assist in this process. Such indicators may relate to aggregate statistics or detailed sectoral analysis.] *N.B. This element is also covered in the policies and measures section;*

(j) Other circumstances: Parties may wish to describe circumstances not covered by the above which explain emissions trends and/or the success or failure of particular policies and measures.]

[Proposal by Australia for subparagraphs 11 (a) to (l)]

(a) Population profile – e.g. total population, growth rate, density and distribution - with trends since 1990; [and greenhouse gas emissions per capita];

(b) Geographic profile – e.g. area, latitude, land-use pattern, and ecosystems;

- (c) Climate profile – e.g. temperature distributions, heating and cooling degree days, rainfall distributions, and variability and extreme events;
- (d) Government structure;
- (e) Economic profile – e.g. gross domestic product (GDP), GDP per capita (expressed in domestic currency and purchasing parities), GDP growth rates, GDP by sector, trade patterns – with trends since 1990; and greenhouse emissions per GDP;
- (f) Energy profile – e.g. energy resources profile, energy supply by fuel (million tonnes oil equivalent), energy prices, energy market structures (oil, gas, coal, hydro, renewables, nuclear), energy policies (e.g. taxes, subsidies and market reform), energy consumption patterns and intensity by sector, and trade in energy commodities including electricity;
- (g) Transport – e.g. features of transport infrastructure (road, rail, sea, air and public transport), vehicle fleet size (cars and commercial), and transport policies (e.g. market reform and subsidies);
- (h) Industry and waste – e.g. industry structure, trends and policies, and waste management practices;
- (i) Building stock and urban form – e.g. profile of residential buildings (type and occupancy), profile of commercial buildings, and urban density and structure;
- (j) Agriculture – e.g. structure, trends and policies (e.g. subsidies), and waste management practices;
- (k) Forestry – e.g. structure, trends and policies (e.g. subsidies);
- (l) Other circumstances.]

12. Where statistics are provided, these [should] be accompanied by a definition of terms unless they are obvious. These may be included in footnotes or as an annex to the communication.

13. Parties requesting flexibility or consideration, in accordance with Article 4.6 and 4.10 of the Convention, [shall] state the type of special consideration they are seeking and provide an adequate explanation of their circumstances.

IV. GREENHOUSE GAS INVENTORY INFORMATION

14. Summary information from the national greenhouse gas inventory prepared according to part I of these guidelines [shall] be provided for the period from 1990 (or other base year) to the last but one year prior to the year of submission of the national communication (e.g. inventory

information up to the year 1999 [shall] be provided in the third national communication to be submitted by 30 November 2001). The information provided in the communication [should] be consistent with that provided in the annual inventory information submission of the year in which the communication is submitted.

15. For the purpose of the communication, complete inventory information need not be provided. However, at a minimum, Parties [shall] report the summary, including CO₂ equivalent and emissions trend tables given in the common reporting format contained in the above-mentioned guidelines. These tables may be provided as an annex to the communication rather than in the main text.

V. MITIGATION PLANS

A. Policies and measures

16. Article 12.2 requires Annex I Parties to communicate information on policies and measures adopted to implement commitments under Article 4.2(a) and (b). These need not have the limitation and reduction of greenhouse gas emissions as a primary objective.

17. This information [should] describe the overall policy context, including national targets for greenhouse gas mitigation, in addition to Convention commitments. Strategies for sustainable development or other relevant policy objectives may also be covered. Relevant inter-ministerial decision-making processes or bodies [should] be noted.

18. In reporting, Parties [shall][should] give priority to policies, or combinations of policies, which have the most significant impact in limiting or reducing greenhouse gas emissions and may also indicate those which are innovative and/or effectively replicable by other Parties. The national communication does not have to report every policy and measure which affects greenhouse gas emissions.

18 bis. [Parties [should] provide information on how they believe their policies and measures are modifying longer-term trends in anthropogenic emissions consistent with the objective of the Convention.]

*[Revised proposal from the co-Chair reflecting discussions in the joint contact group.
Paragraphs 19-21 and table 1]*

Parties [shall] organize the reporting of policies and measures by sectors, and subdivided by greenhouse gas (CO₂, CH₄, N₂O, HFCs, PFCs, SF₆). Each sector [should] have its own textual description of the principal policies and measures concerned, plus the summary table as shown in table 1, identifying [the name of the policy or measure, the status of implementation, the type of instrument concerned, gas affected, implementing authority, and estimated impact on emissions.] Parties may include a separate text section and table describing cross-sectoral policies and measures.]

[If the co-Chair's proposal is accepted, the following three paragraphs and table 1 in its original form would not be needed.]

19. Parties [shall] report on their policies and measures in the text of their national communication, and complete the summary table (table 1) for policies and measures described in the national communication.

20. Parties [shall] organize the reporting of policies and measures by sectors, using as far as possible the sectors shown in table 1. Parties may aggregate or further disaggregate sectors according to national circumstances, and [should] provide information on cross-sectoral policies and measures.

21. For each sector, reporting [should] be further subdivided by greenhouse gas (CO₂, CH₄, N₂O, HFCs, PFCs, SF₆).]

22. In cases where a policy or measure has been maintained over time and is thoroughly described in the Party's previous national communication, reference [should] be made to this and only a brief description contained in the latest national communication, focusing on any alterations to the policy or effects achieved. When policies listed in previous national communications are no longer in place, Parties may explain why this is so.

23. Some information, such as the effect of policies and measures, may be presented in aggregate for several complementary measures in a particular sector or affecting a particular gas.

24. Policies reported on [could] be those decided and /or implemented by governments at national and local level. Furthermore, policies reported [could] also include those adopted in the context of regional or international efforts.

25. The description of each policy and measure [shall] include information on each of the following subject headings listed below. The description [shall] be concise and [could] include information on the detail suggested after each subject heading.

(a) *The objective of the policy or measure.* The description of the objectives [should] focus on the key purposes and benefits of the policies and measures. Objectives [should] be described in quantitative terms to the extent possible;

(b) *The greenhouse gas or gases affected;*

(c) *Type or types of policy or measure.* Use to the extent possible the following terms: economic, fiscal, voluntary, regulatory, information, education, research, other;

(d) *Status of implementation.* It [should] be noted whether the policy or measure is in the planning stage or is under legislative consideration, or whether a legislative decision (or decision by another relevant body) has been taken. For policies having been decided by the

relevant authority, the stage of implementation they are at [should] be noted. Information may include the funds already provided, future budget allocated and the planned time-frame for the implementation of the policy or measure;

26. The following information may [should] be included in the description of each policy and measure reported;

(a) *Greenhouse gas mitigation monitoring and results.* This [should] cover a description of the way in which progress with policies and measures to mitigate greenhouse gas emissions is monitored and evaluated over time. Institutional arrangements for monitoring of greenhouse gas mitigation policy may [should] also be reported in this context;

(b) *A quantitative estimate of the impacts of individual policies and measures or collections of policies and measures.* The estimate may be of historic impacts and/or of future impacts. This may be in terms of the underlying activity or emissions affected, compared to the likely level of activity or emissions for the relevant sector in the absence of such policies. This information [should] be presented as an estimate for a particular year such as 1995, 2000 and 2005, not for a period of years. Parties are also encouraged to provide a brief description of how such savings are estimated. This information may be provided for both implemented policies and measures and policies and measures under consideration, but the distinction between the two [should] be clear;

(c) *Information about the costs of policies and measures.* Such information [should] be accompanied by a brief definition of the term 'cost' in this context;

(d) *Information about non-GHG mitigation benefits of policies and measures.* Such benefits [could] include, for example, reduced emissions of other pollutants or health benefits;

(e) *How the policy or measure interacts with other policies and measures at the national level.* This may include a description of how policies complement each other in order to enhance overall greenhouse gas mitigation;

(f) *Level of government and private sector involvement.* This [should] cover whether a central or local government decision is required to instigate the policy, whether funds are provided from state or local budgets and who is the implementing authority. It [should] also cover whether the policy is targeted at the organization, firm or household level etc. and, where possible, note the scale of private sector involvement in terms of funding etc.

27. Parties may [shall] report policies and measures which encourage activities leading to greater levels of greenhouse gas emissions than otherwise, identified in accordance with Article 4.2(e) of the Convention. This might [could] include subsidies to fossil fuel production and consumption or livestock rearing. In addition, policies relating to security of fuel supply may be of relevance in this context.

Table 1. Summary of policies and measures by sector

Sector	Name of policy/measure ^a	Principal gases affected	Type of instrument ^b	Objective by gas ^c	Status of implementation ^d	Implementing authority ^e	Estimate of mitigation impact ^f (for a particular year, not cumulative, CO ₂ equivalents)				
							1995	2000	2005	2010	2020
1. Cross-sectoral											
2. Energy industries											
3. Manufacturing industries											
4. Transport											
5. Residential											
6. Commerce, public sector											
7. Agriculture											
8. Land-use change and forestry											
9. Waste											

Note: Under the co-Chair's proposal for paragraphs 19-21, this version of the table would not be required.

- ^a Parties [should] use an asterisk (*) to indicate that a measure is included in the "with implemented measures" projection.
- ^b To the extent possible the following term [should] be used: economic, fiscal, voluntary, regulatory, information, education, research and other.
- ^c See paragraph 25 (a).
- ^d To the extent possible the following descriptive terms [should] be used: under consideration, decided (year), implemented (year), funding allocated (years, amount), funding planned (years, amount), expected end date (year).
- ^e Central, state, county, municipality.
- ^f This information [should] be included to the extent possible, and where appropriate, taking into account the appropriate level of aggregation.

[Proposal from the co-Chair for table I.]

Summary of policies and measures for sector^a:

Name of policy/ measure ^b	Principal gases affected	Type of instrument ^c	Status of implementation ^d	Implementing entity or entities ^e	Estimate of mitigation impact ^f (for a particular year, not cumulative, in CO ₂ equivalents)			
					1995	2000	2010	2020

^a Separate tables [should] be completed for each sector. To the extent appropriate, the following sectors [should] be considered: energy industries, manufacturing industries, transport, residential, commerce/public sector, industrial processes, agriculture, land-use change and forestry, waste. A table [could] also be completed for any cross-sectoral policies and measures.

^b Parties [should] use an asterisk (*) to indicate that a measure is included in the "with implemented measures" projection.

^c To the extent possible the following terms [should] be used: economic, fiscal, voluntary, regulatory, information, education, research and other.

^d To the extent possible the following descriptive terms [should] be used: under consideration, decided (year), implemented (year), funding allocated (years, amount), funding planned (years, amount), expected end date (year).

^e For example, central government or federal authority, private sector, county, municipality.

^f This information [should] be included to the extent possible, and where appropriate, taking into account the appropriate level of aggregation.]

B. Projections and assessment of effects of measures

28. The primary objective of the projections is to give an indication of future trends in emissions and removals, given current national circumstances, including implemented policies and measures. To this end a "with implemented measures" projection [shall] be presented. This projection [shall] be designed to encompass latest available information on all policies and measures implemented by the Party at the time of preparation of the national report.

29. Parties [may][shall] provide an additional ["with new measures"] calculation assessing the total effect of all new policies and measures implemented since the submission of their last national communication. [Parties may use either a "without measures" scenario or another approach.]

29 bis. [Parties [may] provide in addition, where possible, a calculation assessing the total effect of all policies and measures implemented since 1990. This information [should] be clearly separated from the elements referred to in paragraph 28 above. Parties may use either a "without measures" scenario or another approach.]

30. [Parties are encouraged to provide an estimate of the total effects of those policies and measures which are under consideration. This information [should] be clearly separated from the [mandatory] elements referred to in paragraphs 28 and 29 [and 29 bis] above. Parties may use either a "with additional measures" scenario or another approach.]

31. In view of the objective of the Convention and the intent to modify longer-term trends in emissions and removals, Parties [shall] include projections on a quantitative basis for the years 2005, 2010, 2015, and 2020. [Parties [shall] also include projections for the first commitment period].

32. The starting point of the projections [shall] be consistent with the inventory data in the national communication. Differences between the inventory and projections, such as ~~exclusion of some sectors~~ (USA) or statistical differences, [shall] be explained. If Parties carry out any adjustments to activity data or projected emissions for the starting point of their projections, for example, for climate variations or trade patterns in electricity, both adjusted and unadjusted data [shall] be reported with a clear link to the inventory data and explanation of the methods used. For the "with implemented measures" and the optional "with additional measures" scenarios, the starting point [shall] be the latest year for which inventory data are available in the national communication. ~~The starting point for the optional "without measures" scenario [should] be the last national communication and, where possible, 1990.~~ (EU), (USA - proposes to delete only the words "and where possible, 1990")

[Proposal of Switzerland on paragraphs 28-30 and 33: The description of the requested scenarios in paragraphs 28-30 is confusing. It should be rearranged and systematized (e.g. by adding a table as suggested below) to make the scenario specification unambiguous. Adapt paragraph 33 accordingly.

Para	Scenario name	Description	Scenario starting point
28	"with implemented measures"	All implemented measures at time of projection	Latest available inventory year
29	"with new measures" (EU; USA: no name given)	New policies and measures implemented since the preceding national communication	Latest inventory available when submitting previous national communication?
29	"with all measures" (EU; USA: no name given)	All policies and measures implemented since 1990	1990?
29	"without measures" (USA)	?	?
30	"with additional measures"	Total effects of policies and measures under consideration	Latest available inventory year]

33. [Projections [shall] be made on a gas-by-gas basis for emissions and removals of the following greenhouse gases: CO₂, CH₄, N₂O, PFCs, HFCs and SF₆. Parties are encouraged to provide projections of the indirect greenhouse gases CO, NO_x and NMVOCs, as well as sulphur oxides. (Previous paragraph 31)] ~~Parties [shall] provide projections on a sectoral basis,~~ [Projections [should] be further subdivided on a sectoral basis.] (EU) to the extent possible using the same sectoral categories as in their GHG inventory reporting. ~~Parties [shall] summarize the results of the projections by gas and, to the extent possible, by sector, using the emission trends table used for inventory reporting.~~ (CHE) In addition [to summarizing the results of the projections by gas and, to the extent possible, by sector] (CHE), projections [shall] be provided in an aggregated format, using GWP values agreed upon by the Conference of the Parties.

34. To ensure consistency with inventory reporting, projections of emissions based upon fuel sold to ships and aircraft engaged in international transport [shall] not be included in national totals but reported separately. ~~Similarly, projections of emissions from the land-use change and forestry sector [shall] not be included in projections of national totals but reported separately.~~ (USA - Discussion of the land-use change and forestry sector [should] be separate from the bunker issue. Projections from land-use change and forestry [should] be reported as a sector of the economy, like in previous national communications and in the inventory guidelines, and reported as part of the national totals. This language was not discussed at the workshop.)

35. When projecting greenhouse gas emissions and removals, and estimating the specific and total effect of policies and measures on emissions and removals, Parties may use any model(s) and/or approach(es), provided sufficient information is given to allow a third party to obtain a qualitative understanding of the model(s) and/or approach(es) used. [Parties are also encouraged

to publish separately a full methodological description of the model(s) used, for reasons of transparency.] (EU)

36. In the interests of transparency, for each model or approach used, Parties [shall]:

- (a) Describe the type of model or approach used, its characteristics (for example, top-down model, bottom-up model, accounting model, expert judgement);
- (b) Describe the original purpose for which the model was designed and, if applicable, how it has been modified for climate change purposes;
- (c) Summarize the strengths and weaknesses of the model or approach used and provide an indication of its scientific and technical credibility;
- (d) Explain how the model or approach used accounts for any overlap or synergies that may exist between different policies and measures;
- (e) Provide references or Internet addresses for more detailed information on the model or approach.

37. To ensure transparency, national communications [shall] report the key assumptions and variables used to develop projection(s) of greenhouse gas emissions and removals and estimate(s) of the total effects of policies and measures on emissions and removals. Parties [shall] summarize historic and assumed values of key variables by completing table 2 below, identifying which assumptions were used for the different scenarios provided. (USA - this must be optional according to the structure of the model.), (EU - it should be made clear what are key variables and what are key assumptions.)

Table 2. Summary of key variables and assumptions in the projections analysis

	Historic ^a					Assumed				
	1975	1980	1985	1990	1995	2000	2005	2010	2015	2020
Variable 1 (e.g. world coal prices - real/nominal (US\$/ton))										
Variable 2 (e.g. world oil prices (US\$/bbl))										
...										

^a Information [should] be provided for at least the period 1990 onwards.

38. An illustrative list of key variables and assumptions that may be required to project greenhouse gas emissions and removals or to estimate the specific effects of policies and measures and their costs may include the following: (EU - it should be made clear what are key variables and what are key assumptions), (USA - these will probably vary by model; some will be inputs to a model, the same may be calculated within another.)

- (a) GDP level (national currency) and annual growth rate (consistent with economic forecasts of the Party);
- (b) Assumptions on exchange rates between the domestic currency and the United States dollar;
- (c) Population level (millions) and compound annual growth rate;
- (d) Interest rate and public sector discount rate, where available;
- (e) Annual rate of autonomous energy efficiency improvement in total and by sector;
- (f) Total housing, including turnover (number of dwellings);
- (g) Commercial floor space, including turnover (thousands of square kilometres);
- (h) Vehicle-kilometres travelled by vehicle type (thousands);
- (i) Policy context (description of significant measures that reduce emissions or enhance removals that have been incorporated in the projection, as well as how they were incorporated);

- (j) Rate of penetration and absolute levels of use of new end-use technologies;
- (k) World fuel prices;
- (l) Relative costs of different electricity-generating plants;
- (m) Head of livestock (thousands by species);
- (n) Nitrogen fertilizer and manure use (tonnes of nitrogen).

39. Parties [shall] provide information on key outputs of the model(s) and/or approach(es) used, such as projected energy balances, for the period of the projection. The historic and current activity data, and projected values for key outputs [shall] be summarized by completing table 3. (USA - this is optional according to the structure of the model.)

Table 3. Summary of activity data and other [key] (EU) outputs of the projections analysis

	Activity data ^a					Projection				
	1975	1980	1985	1990	1995	2000	2005	2010	2015	2020
Variable Key output (EU) 1 (e.g. primary energy demand (PJ))										
Variable Key output (EU) 2 (e.g. index of industrial production (1990=100))										

^a Information [should] be provided for at least the period 1990 onwards.

40. An illustrative list of **other** (EU) key outputs that may be produced when projecting greenhouse gas emissions and removals or estimating the specific effects of policies and measures may include the following: (USA - these will probably vary by model; some will be inputs to a model, the same may be calculated within another.)

- (a) Primary energy production by fuel type (petajoules);
- (b) Primary energy demand by fuel type, as well as electricity (petajoules);
- (c) Energy demand by sector (petajoules);

- (d) Final energy consumption by end-use (petajoules);
- (e) Energy imports/exports (petajoules);
- (f) Primary energy per unit of production in the industrial and commercial sectors;
- (g) Energy consumption per square metre in the residential and commercial sectors;
- (h) Primary energy for transport (per tonne-km or passenger-km);
- (i) Electricity and heat produced per unit of fuel used in thermal power stations;
- (j) Rice cultivation (area cultivated in hectares);
- (k) Forest area cleared (thousands of hectares);
- (l) Landfill waste disposal (tonnes);
- (m) Waste-water biochemical oxygen demand (kg).

41. Parties ~~[shall]~~ [should] (USA) report the main differences in the assumptions, methods employed, and results between projections in the current national communication and those in earlier national communications.

42. The level of uncertainty associated with the projections and underlying assumptions ~~[shall]~~ be discussed qualitatively and, where possible, quantitatively. In addition, Parties are encouraged to provide the results of sensitivity analyses and/or a range of scenarios, to illustrate the sensitivity of the future emissions trends to variations in key assumptions.

43. Parties are encouraged to have their projections peer-reviewed by independent ~~national~~ (EU) experts.

44. Parties are encouraged to share with others their experience with the preparation of projections and to make all relevant information available to other Parties.

VI. VULNERABILITY ASSESSMENT, CLIMATE CHANGE IMPACTS AND ADAPTATION MEASURES

45. A communication ~~[shall]~~ review briefly the expected impacts of climate change for the Party concerned and outline the actions taken to implement Article 4.1(b) and (e) with regard to adaptation. Parties are encouraged to use the IPCC Technical Guidelines for Assessing Climate Change Impacts and Adaptations. Parties ~~[could]~~ refer, *inter alia*, to integrated plans for coastal zone management, water resources and agriculture. Parties are also encouraged to report on specific results of scientific research in the field of vulnerability assessment and adaptation.

VII. FINANCIAL RESOURCES AND TRANSFER OF TECHNOLOGY

46. In accordance with Article 12.3, Annex II Parties [shall] provide detailed information on the activities undertaken to give effect to their commitments under Article 4.3, 4.4, and 4.5, as follows.

47. Parties [shall] indicate what "new and additional" financial resources have been provided to meet the agreed full costs incurred by developing country Parties, in complying with their obligations under Article 12.1. Parties [shall] clarify how they have determined such resources as being "new and additional" in their national communications.

48. Parties [shall] provide, [where feasible,] (EU) information on the provision of financial resources to meet the agreed full incremental costs incurred by developing countries in their implementation of measures covered under Article 4.1 of the Convention [and that are agreed between a developing country Party and the international entity or entities referred to in Article 11, in accordance with that Article.] (USA) When communicating this information Parties [shall] complete tables 4 and 5 below.

(EU - table 4: Insert "and programmes" after "Multilateral institutions" in the first column and add the following footnote: "Parties may refer either to their overall contributions to all multilateral institutions and programmes or refer specifically to the multilateral institutions and programmes listed below."; in footnote 2, insert "also" after "Parties"; insert a column for 1997.)

(EU - table 5: Insert the following text as footnotes to "Mitigation" and to "Adaptation" in column-headings: "Parties may use other sectoral categories as appropriate"; insert a column headed "Other" under "Mitigation" to take account of cross-sectoral projects. The differentiation of the financial contributions on adaptation seems not to be suitable. Columns 9 and 10 should be merged with the new title "Other". If more detailed information is needed on adaptation projects, it can be extracted from the project descriptions; a table should also be provided for 1997.)

(CHE - Precision should be added in the table as to what is meant by "adaptation"; this could be done by adding a footnote with a definition or an indicative list of the range of intended activities, e.g., on the basis of GEF funded activities.)

49. Parties [shall] provide detailed information on the assistance provided for the purpose of assisting developing country Parties that are particularly vulnerable to the adverse effects of climate change in meeting the costs of adaptation to those adverse effects, in textual format and with reference to table 5 below. [Parties [should] provide information on assistance to the developing country Parties that are particularly vulnerable to the adverse effects of climate change in meeting the costs of adaptation to those adverse effects.] (USA)

50. Parties [shall], when reporting activities related to the promotion, facilitation and financing of the transfer of, or access to, environmentally sound technologies, clearly distinguish

~~between activities undertaken by the public sector and by the private sector.~~ (USA) As the ability of Parties to collect information on private sector activities is limited, Parties may indicate, where feasible, in what way activities by the private sector help meet the commitments of Parties under Article 4.3, 4.4 and 4.5 of the Convention.

51. Parties [shall] report on some significant success stories [or failures] (CHE) related to technology transfer, using table 6 below. Parties [shall] also report their activities for financing access by developing countries to "hard" or "soft" environmentally sound technologies.¹

52. ~~Parties are encouraged to report, in textual format, information on practicable steps taken by governments to promote, facilitate and finance transfer of technology, and to support development and enhancement of endogenous capacities and technologies of developing countries.~~ [Parties are encouraged to report, in textual information, on practicable steps to promote, facilitate and finance, as appropriate, the transfer of, or access to, environmentally sound technologies and know-how to other Parties, particularly developing country Parties, to enable them to implement the provisions of the Convention.] (USA)

¹ The term "transfer of technology", as used here, encompasses practices and processes such as "soft" technologies, for example, capacity-building, information networks, training and research, as well as "hard" technologies, for example, equipment to control, reduce or prevent anthropogenic emissions of greenhouse gases in the energy, transport, forestry, agriculture, and industry sectors, to enhance removals by sinks, and to facilitate adaptation. [The secretariat was requested to elaborate the existing definition of "hard and soft" technology for discussion at the tenth sessions of the subsidiary bodies.]

VIII. RESEARCH AND SYSTEMATIC OBSERVATION

53. Pursuant to Articles 4.1(g), 5 and 12.1(b), Annex I Parties [shall] communicate information on their actions relating to research and systematic observation. ~~This [shall] include,~~ [With respect to research, Parties [shall] provide,] (USA) *inter alia*, information on:

- (a) Research on the impacts of climate change;
- (b) Modelling and prediction, including general circulation models;
- (c) Climate process and climate system studies;
- (d) Socio-economic analysis, including analysis of both the impacts of climate change and response options; ~~and~~ (USA)
- (e) Technology research and development; [and] (USA)
- (f) [For items (a) - (e) above, identify the opportunities for and barriers to free and open international exchange of data and information.] (USA)

54. (Previously para. 57 - EU and USA) With respect to systematic observation and related data and monitoring systems, Parties [shall] provide information on the current status of national plans and support in the following areas:

- (a) Atmospheric observing systems, including those measuring atmospheric constituents;
- (b) Ocean observing systems;
- (c) Terrestrial observing systems, including those dealing with land-surface properties, ice masses and freshwater resources; ~~and~~ (USA)
- (d) Support for developing countries to establish and maintain observing systems and related data and monitoring systems; [and] (USA)
- (e) [For items (a) - (c) above, identify the opportunities for and barriers to free and open international exchange of data and information.] (USA)

55. (Previously para. 58 - EU and USA) In preparing their communications on systematic observation and related data and monitoring systems, Parties may be guided by the requirements and best practices in documentation prepared by the Global Climate Observing System [, in consultation with SBSTA and the IPCC.] (USA)

56. The communications [~~could~~] [should] (EU) address both domestic programmes and international programmes (for example, the World Climate Programme (WCP), the International

Geosphere-Biosphere Programme (IGBP), the Global Climate Observing System (GCOS)) the IPCC. They [shall] also reflect actions taken to support related capacity-building in developing countries.

57. The communications [shall] be limited to reporting on actions undertaken [and the opportunities for and barriers to international exchange of data and information,] (USA) rather than the results of such efforts. For example, the results of research studies or model runs [data analysis] (EU) [shall] not be included in this section. (USA - proposes to delete second sentence of paragraph.)

IX. EDUCATION, TRAINING AND PUBLIC AWARENESS

58. In accordance with Articles 4.1(i), 6 and 12.1(b), Annex I Parties [shall] communicate information on their actions relating to education, training and public awareness. In this section, Parties [shall] report, *inter alia*, on public information and education materials, resource or information centres, training programmes, and participation in international activities. Parties are encouraged to report the extent of public participation in the preparation or domestic review of the national communication.

X. SYSTEMATIC UPDATING OF THE GUIDELINES

59. Relevant future decisions, once taken by the Conference of the Parties, regarding the reporting of information under the Convention [should] be applied *mutatis mutandis* to these UNFCCC reporting guidelines on non-inventory issues, which [shall] be updated according to the COP.

Annex

STRUCTURE OF THE NATIONAL COMMUNICATION

1. The national communication [shall] be structured according to the outline given below. The outline is based on the [mandatory] elements of the guidelines. Optional elements and any other information Parties wish to provide [should] be included within this framework as appropriate.

1. EXECUTIVE SUMMARY

Summary of all [mandatory] information and data (no more than 15 pages)

2. NATIONAL CIRCUMSTANCES

- 2.1 Population profile
- 2.2 Geographic profile
- 2.3 Climatic profile
- 2.4 Government structure
- 2.5 Economic profile
- 2.6 Energy profile
- 2.7 Transport
- 2.8 Housing stock
- 2.9 Monitoring of greenhouse gas mitigation
- 2.10 Other circumstances

3. GREENHOUSE GAS INVENTORY INFORMATION

Summary of greenhouse gas inventory results. The required summary and trend tables of the common reporting format may be included in an annex rather than in the main text of this chapter.

4. MITIGATION PLANS

4.1 Policies and measures

4.1.1 Descriptive summary of policies and measures

This section [should] also contain table 1 describing policies and measures that have been implemented since 1990, that are significant, innovative and/or potentially replicable.

4.1.2 Description of each policy and measure

This section [should] contain a detailed description of each significant, innovative or potentially replicable policy and measure that the Party has implemented, including:

- (a) Objective(s): gas(es) and/or sector(s) targeted;
- (b) Why it is considered significant, innovative, or potentially replicable;
- (c) Type of policy instrument(s) used;
- (d) Interaction with other policies and measures;
- (e) Status of implementation or commitment;
- (f) How the policy and measure is functioning;
- (g) Indicators of progress.

4.1.3 Policies and practices that lead to greater levels of emissions

4.2 Projections

4.2.1 Projection results

"With implemented measures" gas-by-gas projections of emissions and removals of the following greenhouse gases: CO₂, CH₄, N₂O, PFCs, HFCs and SF₆ for the years 2000, 2005, 2010, 2015, [2020]:

(a) Summary of projections for all gases, sectors, and scenarios including aggregate projections using GWPs;

- (b) Gas-by-gas projections;
- (c) Sectoral projections;
- (d) Projections of bunker fuels;
- (e) Projections of net emissions from land-use change and forestry;

(f) Explanation of differences between projection and inventory (if applicable).
[Should] include both adjusted and unadjusted data with a clear link to the inventory data and explanation of the methods used.

4.2.2 Estimate of total effect of policies and measures

Estimate of the total gas-by-gas effect of policies and measures for emissions and removals of the following greenhouse gases: CO₂, CH₄, N₂O, PFCs, HFCs and SF₆. This information, if presented as a "without measures" scenario, [could] be included in section 4.2.1 (projection results).

5. VULNERABILITY ASSESSMENT, CLIMATE CHANGE IMPACTS AND ADAPTATION MEASURES

- 5.1 Expected impacts of climate change
- 5.2 Adaptation actions taken

6. FINANCIAL RESOURCES AND TRANSFER OF TECHNOLOGY

- 6.1 Provision of "new and additional" resources
Textual information on how "new and additional" was determined
- 6.2 Provision of financial resources
Textual information on the provision of financial resources
- 6.3 Assistance to developing country Parties that are particularly vulnerable to climate change
Textual description of assistance to developing country Parties that are particularly vulnerable to climate change
- 6.4 Activities related to transfer of technology
Textual description of activities related to transfer of technology
- 6.5 Tables
Table 4, table 5, table 6

7. RESEARCH AND SYSTEMATIC OBSERVATION

- 7.1 Actions related to research and systematic observation
 - 7.1.1 Research on the impacts of climate change
 - 7.1.2 Modelling and prediction, including general circulation models
 - 7.1.3 Climate process and climate system studies
 - 7.1.4 Socio-economic analysis, including analysis of both the impacts of climate change and response options
 - 7.1.5 Technology research and development

4.2.3 Method reports

One method report [should] be provided for each method or approach used.

(a) Description of the type of model or approach used

(i) Characteristics

Characteristics of the model (for example, top-down model, bottom-up model, accounting model, expert judgement);

(ii) Original purpose

The original purpose of the model and, if applicable, how modified for climate change purposes;

(iii) Strengths and weaknesses

Strengths and weaknesses, indication of scientific and technical credibility;

(iv) Overlap or synergies

How it accounts for overlap or synergies between different policies and measures;

(v) References

References or Internet addresses for more detailed information;

(b) Assumptions

Table 2 summary of historic and assumed values of key variables used in this method/approach;

(c) Activity data and key outputs

Table 3 summary of historic and current activity data, and projected values for key outputs;

(d) Uncertainty

Qualitative and, where possible, quantitative discussion of uncertainty.

4.2.4 Differences compared to earlier national communications

Differences in the assumptions, methods employed, and results compared to earlier national communications.

7.2 National plans and support related to systematic observation

- 7.2.1 Atmospheric observing systems
- 7.2.2 Ocean observing systems
- 7.2.3 Terrestrial observing systems
- 7.2.4 Support for developing countries

8. EDUCATION, TRAINING AND PUBLIC AWARENESS

- 8.1 Public information and education materials
- 8.2 Resource or information centres
- 8.3 Training programmes
- 8.4 Participation in international activities

Draft guidance for reporting on global climate observing systems	4
--	---

I. INTRODUCTION

A. Mandate

1. The Subsidiary Body for Scientific and Technological Advice (SBSTA), at its tenth session, expressed its appreciation to the secretariat of the Global Climate Observing System (GCOS) for making available preliminary draft guidance relating to reporting on systematic observation, to the UNFCCC workshop on guidelines for the preparation of national communications by Parties included in Annex I to the Convention, held in Bonn, from 17 to 19 March 1999. It noted that the GCOS preliminary draft guidance is undergoing further review. The SBSTA decided to consider the issue at its eleventh session and urged the GCOS secretariat to make the revised draft guidance available in sufficient time for that session (FCCC/SBSTA/1999/6, para. 75 (b)).

B. Background and scope of the note

2. In response to the above mandate, this note contains draft guidance, as prepared by the GCOS secretariat on the recommendations of the GCOS Steering Committee. In preparing the draft guidance, consideration was given to comments provided by: the GCOS/WCRP¹ Atmospheric Observation Panel for Climate (AOPC), at its fifth session, in April 1999; by the GCOS/GOOS² Ocean Observation Panel for Climate (OOPC) at its fourth session, in May 1999; the GCOS/GTOS³ Terrestrial Observation Panel for Climate (TOPC) at its fifth session, in July 1999, and the participants attending the tenth session of the SBSTA.

3. Experts from 13 countries (Australia, Botswana, Canada, China, France, Japan, Mauritius, the Netherlands, Switzerland, Togo, Uganda, the United Kingdom of Great Britain and Northern Ireland and the United States of America) were invited by the GCOS secretariat to provide technical comments on the draft. The present document takes into consideration, where appropriate, comments received up to mid-August 1999. Further technical comments are expected to be provided by the GCOS/GOOS/GTOS Global Observing Systems Space Panel at its fifth session in August 1999. Relevant information from this panel will be made available by the GCOS secretariat at the eleventh session of the SBSTA.

¹ WCRP: World Climate Research Programme.

² GOOS: Global Ocean Observing System.

³ GTOS: Global Terrestrial Observing System.

4. The draft guidance is contained in the annex below.⁴ In summary, it proposes that the systematic observation section of a national communication should be divided into five subsections. The first of these would be a general section and would describe:

(a) The present status of national programmes to meet the needs for meteorological and atmospheric, oceanographic and terrestrial observations of the climate system;

(b) The extent to which the data from the Party's national networks are being exchanged with other Parties and provided to international data centres;

(c) The actions taken or planned to support the building of capacity in developing countries to acquire and use climate information; and

(d) The actions taken or planned to strengthen international and intergovernmental programmes associated with global observing systems for climate.

5. Three additional subsections would provide information on meteorological and atmospheric observations, oceanographic observations and terrestrial observations. A fifth subsection, on space-based observation programmes, would provide information on the operation and/or use of satellite data.

C. Possible action by the SBSTA

6. The SBSTA may wish to consider the information in this note and determine whether a review by Parties is warranted and whether or how elements of the guidance might be modified and reflected in either of the texts contained in documents FCCC/SBSTA/1999/INF.6 and Add.1.

⁴ The draft guidance made available by the GCOS secretariat, as provided in the annex to this document, is reproduced as received, without formal editing by the Convention secretariat.

Annex

**DRAFT GUIDANCE FOR REPORTING ON GLOBAL
CLIMATE OBSERVING SYSTEMS**

1 PURPOSE

The purpose of this guidance for the preparation and reporting of information on systematic observations for the purposes of the United Nations Framework Convention on Climate Change (UNFCCC), by Annex I Parties and, as appropriate, non-Annex I Parties to the Convention, is to:

- (a) Assist Parties in meeting their commitments under Articles 4.1(g), 5 and 12.1(b) of the Convention and Articles 3.3 and 3.4 of its Kyoto Protocol taking into account decision 14/CP.4 of the Conference of the Parties (COP);
- (b) Facilitate the process of gathering and synthesising information on systematic observations contained in annual submissions and in national communications, including the preparation of global technical analysis and synthesis documentation;
- (c) Facilitate the process of informing future sessions of the COP regarding development of observational networks, difficulties encountered, inter-alia, with respect to the needs of developing countries and options for financial support to reverse any deterioration in observational networks; and
- (d) Facilitate the process of identifying the priority needs for action to improve global observations for climate in relation to the needs of the Convention.

2 NEEDS OF THE UNFCCC FOR SYSTEMATIC OBSERVATIONS

Drawing on the experience of, inter alia, the Intergovernmental Panel on Climate Change (IPCC), the Global Climate Observing System (GCOS) has established the requirements for an integrated global climate observing system to meet the basic needs of the UNFCCC. As presented to COP 4,¹ these requirements are that such an integrated observing system must provide data to:

1. Characterize the current climate, including its inherent variability and extreme events;
2. Obtain information useful to detect climate change, determine the rate of change and assist in attributing the causes of change;

¹ Contained in document FCCC/CP/1998/MISC.2 and summarized in document FCCC/CP/1998/7.

3. Provide observations to determine climate forcing resulting from changing concentrations of greenhouse gases and other anthropogenic and natural causes;
4. Provide observations to evaluate models and assist in prediction of the future climate;
5. Contribute observations to understand and quantify impacts of climate change on human activities and natural systems.

3 GLOBAL OBSERVING SYSTEMS FOR CLIMATE

The observations of the climate system required to meet the needs of the UNFCCC as well as of other national, regional and international users are global in nature and are provided from a wide range of systems and networks that cover the Atmosphere, Oceans and Land. Creating global data sets requires that the observations be collected in accordance with an internationally co-ordinated strategy. As the responsibility for specifying and coordinating various elements of these systematic observations rests with a variety of agencies and programmes, several international organizations (ICSU, IOC, UNEP and WMO) established GCOS to ensure the development and implementation of a comprehensive approach for systematic climate observations. GCOS participates as a partner in the Integrated Global Observing Strategy (IGOS), which looks at requirements more broadly stated than climate and works with data-providing entities to help ensure that observational gaps are filled through adjustments in current systems, and enhancements and alterations to future systems.

The Initial Observing System (IOS)² which has been specified by GCOS, if implemented, would start to meet many environmental needs, including those of the UNFCCC; but it must continue to evolve as capabilities and understanding grow, and this evolution will require ongoing funding. It must also encompass data management, calibration, validation, quality control and assurance, archiving, assimilation, analysis and dissemination systems. This infrastructure is as important as the hardware to the successful operation of GCOS.

The IOS also specifically addresses the need to adhere to guiding principles that ensure long-term integrity and the need to integrate data fully from both space and surface based observing systems. The GCOS has also documented for the COP the specific components of the IOS that need to be implemented to meet the needs of the UNFCCC.

The responsibility for the actual implementation of individual GCOS components currently lies with national agencies and organizations working within the GCOS framework for the global system. Therefore the implementation of GCOS is fundamentally dependent upon the preparation and implementation of national plans and programmes for systematic observations of the climate system. Such plans and programmes should address both the global observations required for GCOS and the national needs for local and regional observations of climate for national applications and decision making objectives.

² Many details of the IOS can be found at <http://www.wmo.ch/web/geos/geoshome.html>

It needs to be emphasized that the systematic observations identified by GCOS include a wide range of environmental observations collected for many different purposes by a variety of national agencies and organizations. This approach of using in a synergistic manner specific observing systems established for other purposes is clearly highly efficient. However, it requires, in most nations, the introduction of new co-ordination mechanisms as well as the imposition of a new set of demands on the contributing observational networks to meet the GCOS' requirements.

Further, the sophisticated technology required for climate observations requires a high-level of technical capability. In addition, there must be an ongoing transition from "research" observations to fully operational ones. This requires a transition from research funding to funding by operational agencies but not at the expense of the related research which must continue.

4 REPORTING REQUIREMENTS

Reporting on national plans is intended to assist in the development of an initial integrated implementation plan covering global observation systems for climate. Future reports will be essential in the ongoing need to ensure that the observing systems are providing the data required.

In developing a national response, information will likely be required from a number of agencies including those with responsibility for meteorology, hydrology, oceanography, geology, agriculture, forestry, the cryosphere, space programmes, as well as institutions and agencies conducting research in these disciplines and central agencies of government such as foreign affairs and finance. Additional guidance on the requirements contained within the Initial Operational System of GCOS and the interpretation of this guidance is available from the GCOS Secretariat.

General

4.1 The COP has urged Parties to undertake programmes of systematic observation including the preparation of specific national plans, in response to requests from agencies participating in the Climate Agenda, based on the information developed by GCOS and its partner programmes.

Describe the present status of national programme planning for systematic observations to meet the needs for meteorological and atmospheric, oceanographic, and terrestrial observations of the climate system identified by the GCOS and its partner programmes that are required to meet the requirements of the UNFCCC, including planning for and implementation of an Integrated Global Observing Strategy.

Questions to consider could include: Has a national plan for implementing the GCOS requirements been prepared and adopted by the Party? Does the plan contain specific commitments to address the stated GCOS requirements for the territory under the Party's jurisdiction? Has the plan been made available to other Parties and international agencies? If an overall plan has not yet been adopted, is a national plan currently under development and if so what is the time frame for its adoption? If applicable, has the Party's space agency been consulted?

4.2 The COP has urged Parties to undertake free and unrestricted exchange of data to meet the needs of the Convention, recognizing the various policies on data exchange of relevant international and intergovernmental organizations (These include WMO Resolution 40 Cg-XII - Policy and Practice for the Exchange of Meteorological and Related Data and Products, WMO Resolution 25 Cg-XIII - Exchange of Hydrological Data and Products; IOC Resolution XX-11 - Oceanographic Data Exchange Policy).

Describe the extent to which the data from the Party's national networks for the systematic observations required by GCOS and the UNFCCC are currently being exchanged with other nations and provided to the appropriate international data centres. Indicate the extent to which there is adequate guidance on specific policies on data exchange covering GCOS observations. Describe any institutional barriers to the exchange of the data required by GCOS to meet the needs of the UNFCCC.

4.3 The COP has urged Parties to actively support the building of capacity in developing countries, to enable them to collect, exchange and utilize data to meet local, regional and international needs.

List any actions that have been taken or are being planned to be taken by the Party to support the building of such capacity in developing countries.

4.4 The COP has urged Parties to strengthen international and intergovernmental programmes assisting countries to acquire and use climate information;

List any actions that have been taken or are being planned to be taken by the Party since COP 4 to strengthen international and intergovernmental programmes associated with global observing systems for climate.

Meteorological and Atmospheric Observations

4.5 The COP has urged Parties to actively support national meteorological and atmospheric observing systems, including measurement of greenhouse gases, to ensure that the stations identified as elements of GCOS networks, based on the WWW and GAW, and underpinning the needs of the Convention are fully operational and use best practices.

Describe any national programmes that are in place to meet the needs of GCOS for meteorological and atmospheric observations including the GCOS Surface Network (GSN)³, GCOS Upper Air Network (GUAN) and Global Atmosphere Watch (GAW)⁴

³ See <http://www.wmo.ch/web/gcos/geoshome.html> for details of GSN and GUAN requirements.

⁴ GAW requirements are specified by the WMO Executive Council Panel of Experts on Environmental Pollution and Atmospheric Chemistry and its best practices are guided by GAW Quality Assurance/Science Activity Centres and calibration centres.

requirements, and the degree to which these observations adhere to guidelines for best practices.⁵

Questions to consider could include: Are the data being exchanged internationally? Have metadata been provided to the World Data Centres? Is the Party operating any part of the international quality control and archiving programme?

To facilitate integration of national reports to provide information on the state of the *global* meteorological and atmospheric observing systems, the Party's report might include information such as the following:

	GSN	GUAN	GAW	Other*
For how many stations is the Party responsible?				
How many of those are operating now?				
How many are exchanging data internationally now?				
How many are expected to be operating in 2005?				
Does the Party host an international archiving centre?				
Does the Party host an international QA/QC centre?				

Note: * Provide brief details

Oceanographic Observations

4.6 The COP has urged Parties to actively support national oceanographic observing systems, to ensure that the elements of the GCOS and the Global Ocean Observing System (GOOS) networks in support of ocean climate observations are implemented and, to the extent possible, support an increase in the number of ocean observations, particularly in remote locations, and to establish and maintain climate reference sites.

Describe any national programmes that are in place to meet the needs of GCOS for oceanographic observations⁶ including, for example, sea surface temperatures, sea level, temperature and salinity profiles, and energy and carbon fluxes requirements and the degree to which these observations adhere to guidelines for best practices.⁷

Questions to consider could include: Are the data being exchanged internationally? Is the Party operating any part of the international quality control and archiving programme?

To facilitate integration of national reports to provide information on the state of the *global* oceanographic observing systems, the Party's report might include information

⁵ GSN and GUAN best practices are given in the WMO Manual on the Global Observing System sections 2.10.3.17 and 2.10.4.9 respectively.

⁶ See http://ioc.unesco.org/goos/act_pl.htm for details of ocean observation requirements and for guidance on best practices.

⁷ See http://ioc.unesco.org/goos/act_pl.htm for details of ocean observation requirements and for guidance on best practices.

such as the following:

	VOS	SOOP	TIDE GAUGES	SFC DRIFTERS	SUB-SFC FLOATS	MOORED BUOYS	ASAP
For how many platforms is the Party responsible?							
How many are exchanging data internationally now?							
How many are expected to be operating in 2005?							
Does the Party host an international archiving centre?							
Does the Party host an international QA/QC centre?							

Terrestrial Observations

4.7 The COP has urged Parties to actively support national terrestrial observing systems including programmes to collect, exchange and preserve climate related terrestrial data according to the priorities of the GCOS and the Global Terrestrial Observing System (GTOS) and particularly for those data derived from hydrosphere, cryosphere and ecosystem observations.

Describe any national programmes that are in place to met the needs of GCOS for terrestrial observations⁸ including the Global Terrestrial Network – Glaciers (GTN-G),⁹ Global Terrestrial Network – Permafrost (GTN-P),¹⁰ and the Global Terrestrial Network – Carbon (FLUXNET),¹¹ and other networks monitoring land use, land cover, land use change and forestry, fire distribution, CO₂ flux, glaciers, snow and ice extent, and permafrost, and the degree to which these observations adhere to guidelines for best practices. As the GCOS requirements for hydrological data are still being developed, at this stage only a general description of probably relevant programmes, particularly in the context of WMO Resolution 25 Cg-XIII, should be provided. The requirements will almost certainly include a range of parameters such as surface waters storage fluxes and flow discharge, ground water storage fluxes, evapotranspiration, soil moisture, precipitation and water use, on a range of time scales.

⁸ See http://www.wmo.ch/web/gcos/pub/topv2_1.html#contents for a general outline of terrestrial observations requirements.

⁹ See <http://www.geo.unizh.ch/wgms/> for guidance on GTN-G requirements and best practices.

¹⁰ See <http://www.geography.uc.edu/~kenhinke/CALM/> for guidance on GTN-P requirements and best practices.

¹¹ See <http://www-eosdis.ornl.gov/FLUXNET/fluxnet.html> for guidance on FLUXNET requirements and best practices.

Questions to consider could include: Are the data being exchanged internationally? Do metadata exist for these networks? Is the Party operating any part of the international quality control and archiving programme?

To facilitate integration of national reports to provide information on the state of the *global* terrestrial observing systems, the Party's report might include information such as the following:

	GIN-P	GIN-G	FLUXNET
For how many sites is the Party responsible?			
How many of those are operating now?			
How many are exchanging data internationally now?			
How many are expected to be operating in 2005?			
Does the Party host an international archiving centre?			
Does the Party host an international QA/QC centre?			

Space-based Observing Programmes¹²

Information under this heading may not need to be provided by all Parties. However, it should be included in the report of a Party which operates a space programme, or which uses satellite data to derive climate-related observations. In view of the importance of satellite data time series for global climate monitoring, relevant reports should indicate the priority given by space agencies to ensuring data quality and long-term data continuity in conformity with climate observing requirements and principles.

Questions to consider could include: Does the programme give explicit recognition to the need for long-term continuity and has it adopted procedures that are in conformity with climate observing requirements and principles? Are the data provided to international programmes or other countries in accordance with GCOS principles? Is the Party operating any part of the international satellite quality control and archiving programme? What meteorological, atmospheric, oceanographic and terrestrial satellite observations and products for climate purposes are provided as contributions to international programmes?

To facilitate integration of national reports to provide information on the state of relevant *global* space-based systems, both operational and research, the Party's report might include information such as the following:

¹² The GCOS Plan for Space-based Observations, Version 1.0, June 1995 (GCOS-15) is available at <http://www.wmo.ch/web/gcos/publist2.html#plan> while GCOS space-based observations requirements can be found by specifying GCOS as the user in http://sat.wmo.ch/stations/_asp_bty_idc/Requirementssearch.asp

	Possible response
Does the Party have a space programme?	Series/mission/ instrument
Is there a commitment to data quality and continuity for climate purposes?	Yes/Planned/No
Are there national programmes to derived climate data from space-based data?	Domain(s): atmosphere/ ocean/terrestrial
Are climate data sets distributed regularly?	
Are the data made freely available?	
Does the Party host an international archiving centre?	
Does the Party host an international QA/QC centre?
